IDENTIFIERS	*South Africa

ABSTRACT

This guide for students contains information on the more than 2,200 programs offered at institutions of higher education in South Africa, as well as on the approximately 1,200 bursaries that provide student financial aid. The first section urges students to adopt a long-range life planning approach to choosing a career and college. The next section presents brief descriptions, organized by field of interest, of typical occupations that require higher education. The following section provides course information by field of study, including university name, course name and degree, duration, and entry requirements. The following two sections present the same information for technikons, training institutions providing career-oriented education, and private colleges, respectively. Also provided is a list of technical colleges, with each college's courses and requirements listed. The section on bursaries distinguishes between scholarships (student aid based on academic merit) and bursaries (student aid based on both merit and need). Information on bursaries, loans, and other forms of financial aid are arranged in alphabetical order. Indexes to the bursaries are by field of study and institution. A final section provides addresses and phone numbers of the institutions listed in the directory. (DB)

Qualify with

There are many things you want to achieve in life, so choosing the right college to help you is important. INTEC offers you the widest range of top quality courses and excellent tutorial support to help you achieve your goals.

Enrol now and enjoy the support of tutors who are experts in their fields. Study with INTEC at home in your own time, at your own pace. We'll help you to enhance your career and enrich your future!

focus on computer courses

DEVELOP YOUR COMPUTER KNOW-HOW and move into an EXCITING and LUCRATIVE CAREER

In today's information age you cannot afford to be left behind – computers are now part of business and everyday life. To survive and remain competitive you must master computer skills and then constantly adapt to their related applications and technologies. Luckily you can become computer literate at any age. With INTEC Computer School you can do it at your own pace, in your own time and in your own learning environment.

We offer computer courses ranging from basic computer literacy to application training, programming and networking courses.

Choose from these Computer Courses offered by INTEC:

Preface

Unemployment is a reality that will remain with us for the foreseeable future. However, research shows that in South Africa, as in most other industrialized countries, the demand for people with high-level skills is rising constantly. Postschool education and the development of job-related skills are therefore some of the best ways of increasing one's chances of securing employment.

The ***Guide to Higher Education*** forms part of a series of products developed by the HSRC to assist school-leavers in making informed decisions on their future careers. By publishing this guide we want to encourage school-leavers to improve their qualifications and skills before entering the labour market.

The 1998 guide contains information on more than 2 200 courses offered at institutions of higher education in South Africa. When compiling the information it was interesting to note the changes in the provision of higher education. New education providers are entering the market, new courses are being designed and the content of existing courses is being adapted to meet the needs of the labour market. This emphasizes the need for up-to-date information. Regular users of the guide are therefore encouraged to use the most recent editions of the publication, which is updated annually.

The cost of higher education is increasing every year. Bursaries can assist in alleviating this burden for students and parents. The guide contains information on approximately 1 200 bursaries available for study at the various higher education institutions in the country.

A new addition to the publication is the short descriptions of a number of occupations that require higher education. This was added because of the need expressed by users for career information linked to information on study opportunities. We hope that this information will make a useful contribution to career guidance.

To all students who intend enrolling for higher education in 1999, we wish you success in your endeavours. The time, money and energy that you are about to invest in your education will without any doubt be a sound investment.

YOUR GUIDE TO CHOOSING HIGHER EDUCATION IN SOUTH AFRICA

INTRODUCTION

Do you view the choice of a career as simply a process of *matching an individual and an ideal career?* Consider this view carefully. Some of the *incorrect* implications that stem from it are the following:

- You are only suited for one "ideal" career - a match that requires a "perfect" fit between your characteristics and the demands of the career:
- there are enough careers available - it is just a matter of choosing the "right" one:
- you have only one opportunity to make a choice - a choice you are supposed to commit yourself to for the rest of your life:
- you must first make your career choice - and then you can build the rest of your life around that choice:
- you need training only at the initial stage of the career of your choice - training that will be sufficient for the rest of your working life.

When considering these statements, you will probably realize that the *matching model* has made people very anxious about making the "one big correct choice". Another disadvantage of this model is that it generates the expectation that there are enough careers available for everybody and that careers and organizations are stable phenomena.

Why has the mindset of one-job-for-life become outdated? In the age we are living in, known as the information age, many of the traditional work practices, jobs and employment patterns are disappearing. Although job titles still exist, organizations now place less emphasis on careers and greater emphasis on the tasks and assignments that need to be done. Unemployment is widespread and life-long careers have to a large extent become something of the past. Virtually all employees will have to acquire specialist skills to keep themselves abreast of the latest developments in their field and indispensable in the workplace. In a certain sense everyone will have to become an entrepreneur.

It is therefore expected that people will change jobs more frequently. There will be more temporary workers than permanent workers. The new world of work will include frequent transitions, with contracts and consultancies being the norm. People will experience more stress because of the insecurities that accompany having to cope with changes on a ongoing basis.

This means that your initial career will probably not be the only time you have to make a career choice. In the future you will have to continuously develop new skills; some of you will even have to go right back to the beginning and choose a new career in order to meet the demands of the changing world of work. It is because of this that an alternative orientation - other than the one-job-for-life-mindset - will be useful to you. This alternative approach is known as the *life planning* approach.

LIFE PLANNING APPROACH

The life planning approach offers you a broader perspective on how to manage your many life decisions. Choosing a career is one example of a life decision. This approach draws on some elements of the traditional view, but it goes further in that it incorporates the link between individuals, families and communities. It is a holistic approach because it addresses everyone's need to be a whole person, and it brings the many aspects of life together. It is not meant only for school-leavers - adults also find it very useful.

The best way to describe the new approach is to discuss it in terms of the critical tasks that you have to cope with. These critical tasks include the following:

- understanding yourself
- finding work that needs to be done
- choosing appropriate education and training
- weaving your life into a meaningful whole
- valuing multiculturalism
- managing personal transitions
- exploring spirituality and its connection to work

Please keep in mind that you do not have to complete the first task before moving on to the second one. What is important though, is that you must be able to see the connection between the different tasks and to see them within the context of a lifelong process of being involved with work. As life progresses, and our needs and the world of work change, we will need to reconsider these tasks.
A more detailed explanation of the tasks follows:

Task One: Understand yourself

At this stage you may be confused about making a career choice because of the ever-changing nature of work. A good starting point, however, is to answer the question "Who am I?" A few factors that you may wish to take into consideration in answering this question are your personality, interests and skills.

Personality

It is said that people are most happy doing work that is an expression of their personalities. By doing some self-exploration, you will be able to identify your personal likes and dislikes; you will be able to focus on jobs that you will feel comfortable with and you will be able to concentrate on types of activities that will give you the greatest job satisfaction. For example, if you are an extrovert you may like to work with people, or do work outside the office. On the other hand, if you are an introvert you may prefer to do work that allows you some solitude and quiet times for reflection.

Interests

Interests are things you like to do. In thinking about your interests, remember that they may only be hobby oriented. An interest may also reflect a desire for status rather than a genuine interest in the actual nature of the work, for example an interest in medicine or law.

There is a difference between being good at something and being interested in it. You may find it easy to do mathematics although you don't enjoy the subject, or you may like art, but are not good at it. In such cases you may have to think very carefully before deciding on a job in that direction. If you have ability in a certain field, but not the interest and you wish to capitalize on your ability, you may have to reach a compromise between the two. For example, if you are good at science and technical subjects, but enjoy working with people rather than things, you may consider becoming a teacher or lecturer in the science or technical field.

Skills

Everyone is good at some things and not so good at other things. Many people believe that intellectual ability is the only skill that counts in one's work and learning activities. We therefore often think about our abilities in terms of school marks - but abilities actually involve more than just school marks.

There are things that we are good at around the house and in our free time that can be relevant to certain jobs, for example holding leadership positions in the community, cooking, singing, playing an instrument or fixing things. These are skills that are just as important as school subjects in obtaining work and making a success of a job.

Task Two: Find work that needs to be done

In the past, school-leavers were very unrealistic about their job choices as they based their preferences solely on their so-called psychological profiles without really taking the demands of the job market into consideration. While it makes good sense to answer the question "Who am I?" it is just as important to answer the question "What work is available?" To answer this question you need information on available jobs. You can get this information by consulting newspapers and magazines that advertise jobs, or by talking to as many people about their work as possible. Visit different places of work and consult with counselors and personnel agencies.

Bear in mind that South Africa is now also part of the international job market. In terms of your job hunt you must think and act locally *and* globally. International economic trends nowadays have a major impact on the local job market and you should therefore take cognizance of such trends.

Although intelligence does play [illegible] role in choosing and obtaining work, this single factor has been artificially overemphasized in the past. Motivation, showing responsibility and the willingness to work hard, also play a vital role in achieving success. Consequently, less intelligent people who work hard and make good use of their potential are more likely to be successful than more intelligent people who do not apply themselves. Obviously, however, certain minimum levels of ability are required for certain fields of work or study.

Task Three: Choose appropriate training and education

Be well prepared to do the work of your choice. The best preparation is proper education and training. Increasing importance is being placed on learning - to such an extent that we now speak about lifelong learning. Make sure about the qualifications required for the work of your choice, and in this regard you will find this book very helpful as it gives an overview of educational and training opportunities.

There is a wide variety of study opportunities to choose from. These include study opportunities at universities, technikons, technical and private colleges as well as occupation-specific educational institutions, such as agricultural, nursing and teacher training colleges. In today's competitive job market, you will greatly enhance your chances of finding employment if you acquire specific, marketable skills through education and training. This book is therefore aimed at giving a comprehensive overview of study opportunities at South African educational and training institutions.

Before you enroll for a course, evaluate the course in the following ways:

- Obtain a detailed curriculum from the institution so that you can get an indication of the subjects and topics that are covered.
- Find out how widely recognized the qualification is in the world of work by asking various employers
- Talk to people who have completed the course to find out how useful they found it.
- Try to establish how the training or educational programme you intend following will fit into the new national qualifications framework.
- In certain professions, an authority or professional body controls the standard of entry into the profession by controlling the qualifying courses. Ensure that the course that you choose is in fact recognized by the professional body concerned.

Although there is some overlap between training and educational institutions, it is useful to understand the nature of the different institutions. The following brief description outlines some of the differences between education providers:

Universities

Traditionally, universities provide a broad general background to subjects and are more theoretical than practical. The aim is to provide an understanding of fundamental concepts in a particular discipline.

Admission to a university requires a minimum of a Senior Certificate with Matriculation Endorsement. If you are over 23 years of age and have a school-leaving certificate you may, with the necessary approval, also be admitted to a university.

Many of the degree courses offered at South African universities require specific school subjects and a relatively high level of achievement in those school subjects before a student can be admitted to such courses. This publication spells out the entry requirements for and duration of study for all degree courses at our universities. Please also bear in mind that for certain courses there are only a limited number of openings available and students must therefore be prepared to undergo a selection process. Since most of the universities have early closing dates for applications for some courses, you should make timely enquiries about these dates.

Technikons

Technikons are training institutions that provide career-oriented education of a high standard. You would therefore enrol for a course that provides you with theoretical knowledge as well as practical know-how and skills. Technikons strive for a balance between theory and the application of theory in real work situations.

To acquire skills that are immediately useful to the employer, you have to spend part of your training gaining theoretical knowledge at the technikon and the other part of your training at the work place, learning to do the practical aspects of the work.

You need at least a Senior Certificate (Std 10/Grade 12), or equivalent, to be admitted to a technikon. Technikons offer a wide range of courses that lead to a certificate, diploma, higher diploma as well as Bachelor's, Master's and Doctoral Degrees in technology in selected fields of study. The nature and duration of the courses and the entry requirements are also given in this publication. As in the case of universities, you must apply at an early date for admission. In many instances selection also takes place.

Technical colleges

These are training institutions that equip students with knowledge and skills that prepare them for specific trades or occupations. Here you learn by doing things that will enable you to carry out the particular job at the end of your training.

Studies at technical colleges are open to individuals who have passed at least Grade 9 (Std 7). In some courses, however, you may be required to have passed a higher standard, particularly in mathematics. Technical colleges usually offer technical, commercial, arts and cultural enrichment courses. These courses are referred to as National Technical Certificates (also known as N Certificates) and range from N1 to N6.

Private colleges

You may be surprised to know that private colleges are the largest single sector providing training and higher education to students in South Africa. During the course of last year more than 350 000 students were registered for various courses at private colleges.

Admission requirements vary from a matriculation certificate to specified, usually pre-matriculation minimum educational requirements. For courses aimed at the development of basic skills, no formal educational requirements other than a minimum level of numeracy and literacy are required. In some cases, qualifications attained through completing such courses lead to admission to educational opportunities at a higher level.

Many private colleges offer face-to-face tuition for UNISA degrees, which enables you to obtain a recognized degree in a small class environment. Other private colleges offer a wide range of skilled-based, work-relevant diplomas in association with professional institutes and associations. The courses are practical, recognized and highly effective.

The advantages of enrolling at private colleges are that they offer tuition in small classes or groups, and that they often contract part-time lecturers with outstanding practical experience in their relevant fields. Before enrolling at a private college make sure that it is acknowledged and reputable by establishing whether it is a member of the Association of Private Colleges in Southern Africa (APCSA).

Task Four: Weave your life into a meaningful whole

When making a career choice remember that people have different roles to fulfil in life. Some of the most important life roles concern love (family and parenting), labour (work), learning (formal and informal education and training) and leisure (sports activities, etc.). In your planning, try to give recognition to the relationship between the different roles and somehow try to find a balance between them. Only you can find the balance that is meaningful for your life, but keep in mind that paid work, which provides a minimum standard of living, is essential before other roles can be fulfilled with satisfaction.

It is much easier to choose an occupation than to plan your life together with somebody else, or with a family (of which there are now a number of different types in South Africa). In the past, many people did not see the connection between their work and their family life, which frequently led to family breakdowns.

A major trend in the job market today is that more women are entering the market. Contrary to popular belief, women seem to enjoy different life roles.

Life Planning (continued)

What can you do to find a greater balance between work and family? Here are a few tips:

- Make greater use of home-based work.
- If possible, create more flexible working hours.
- It is not degrading for men to accept a greater family role.
- Do not regard a person's work-family choice as a one-time career decision, since family and career orientations change over time.

Task Five: Value multiculturalism

Another critical task is to deal constructively with differences. South Africa is made up of diverse cultures and the world of work demands an understanding of and respect for people of other cultural orientations.

Training in intercultural workshops can develop interpersonal and communication skills that will help you to deal with cultural differences.

Task Six: Manage personal transitions

Personal transitions refer to the changes you need to make in your lifetime. They can be short, sharp changes, entailing a journey into the unknown, often requiring the courage to take risks and the ability to cope with fear. Examples are losing a job, being transferred or promoted, changing to another organization, retiring, etc.

How can you master personal transitions? There is a three-step model that proposes the following:

1. Be aware of the approaching change.
   Place yourself in a position where you can identify your transition. Can you describe the change in your own words? Where are you in the transition process? How does it change your roles, routines and relationships?
2. Take stock
   Assess your potential resources for coping with your transition. In identifying your resources think about yourself, your situation, your support network and strategies.
3. Take charge
   You can take charge by selecting appropriate coping strategies and developing an action plan. Try also to profit from change by increasing your options, understanding and control of what is happening to you. In order for you to cope with your entry into your first job or to make a job change, you need to take opportunities and obstacles into account. Opportunities are factors in our lives that make it easy for us to achieve certain things. They count in our favour, for example good school marks or previous work experience. There are, however, also other factors that constitute barriers and prevent us from achieving what we would like to achieve. Such obstacles include financial problems, wrong school subjects, or insufficient work skills.

Your plan of action should exploit opportunities and find ways of overcoming obstacles. One of the obstacles you may need to overcome is a lack of training or education. In planning for this you will have to start well in advance and attend to the following:

- Obtain as much information as possible about the job that you are interested in and the qualifications and skills needed to do the job.
- Write to the various educational institutions to obtain information on courses, specific admission requirements and dates for applications.
- Apply and return application forms in good time.
- Find the addresses of institutions that can offer financial help.
- If possible, visit the educational institutions offering the courses you are interested in.

Task Seven: Explore spirituality and its connection to work

Only in the past decade has spirituality become associated with careers. Spirituality can refer to beliefs and a worldview - it does not necessarily imply organized religion. Sometimes spirituality is used to refer to the core of a person from which meaning, self-understanding and life understanding are generated. It can also be seen as the deep integration of all understanding, wholeness and a sense of the interrelatedness of all life. How do you rate yourself on some of the following work values?

- Security
- Advancement
- Creativity
- Self-expression
- Power
- Social contribution
- Leadership

Money
Independence
Relationships
Variety
Achievement
Service
Personal growth

For many people, values are a substitute for spirituality as a guiding force in their lives. Values are beliefs and moral principles that determine how you view your life, what is important to you, what you regard as right and wrong and what kind of person you are striving to be. Values help to identify our most important needs and provide a meaningful way to explore our spirituality. Values give meaning to life and help clarify purpose.

It is appropriate to end this discussion with a quote from Matthew Fox on his explanation of the connection between spirituality and work.

> *Life and livelihood ought not to be separated but to flow from the same source, which is the Spirit. Spirit means life, and both life and livelihood are about living in depth, living with meaning, purpose, joy and a sense of contributing to the greater community.*

Occupations

Introduction

The career environment (workplace) in the 21st century will be different to today's. Many writers have reported that stable careers will not be the norm in the future. These changes in companies, the downsizing of core groups of employees in organisations, the greater use of temporary workers, and the rise in global unemployment must be considered before you make any choices!

It seems that the traditional concept of an employee working for a firm, doing well and experiencing ongoing job security and satisfaction, has been replaced by a new concept based on continuous learning and multiskilling. It is therefore important to note that

- you will have to drive your own career;
- the ultimate goal of the career will be psychological success (feeling of pride and accomplishment);
- you will have to continue learning; the demand in the labour market is shifting from ***know-how*** to ***learn-how***;
- you will have to develop the competency to adapt and develop self-knowledge;
- learning how to learn will be very crucial.

REMEMBER TO THINK ABOUT THIS WHEN YOU CONSIDER INFORMATION ON OCCUPATIONS AND BEFORE YOU MAKE A FINAL DECISION!

How to use this section

- Information on occupations is listed according to fields of interest.
- The section gives a short overview of typical occupations that require higher education. Use these descriptions to decide on the skills with which you want to equip yourself.
- Use the alphabetical list of occupations at the end of this section to trace the occupation in which you are interested. The index will refer you to the relevant page number.

[redacted]

ACTOR / ACTRESS

Actors use speech, make-up, costumes and gestures to portray characters in stage, films, television and radio productions.

To find work, they attend auditions where they demonstrate their acting ability to those in charge. If hired, they must attend long rehearsals and memorise lines and cues. In addition, they may have to attend special classes (in dancing or singing, for example) if this is required for the part.

Travel may be required when plays go on tour or filmed productions are to be shot in particular locations. Many actors/actresses must rely on other jobs while waiting for acting engagements.

ANIMATOR

An animator draws a series of sketches or pictures, each showing a brief portion of an action, which is photographed to give an effect of continuous movement when run through a projector.

Animators themselves make only the key drawings referred to as 'extremes'. These drawings on the animator's underlit drawing board are necessary for showing the action-spacing instructions that guide the animator's assistant in doing the intermediate drawings needed to complete the depiction of the action.

When all the drawings have been completed and assembled, the action is checked. Flipping through the pages will reveal any error in the action sequence, and the relevant drawing can then be corrected. The drawings are then photographed in sequence. Sound effects are mixed with speech on the dialogue track and combined with the optical negative for the final composite print.

ARCHITECT

The architect is professionally trained to design and decorate buildings, with a view to utility, durability, convenience and aesthetic appeal. Architects use their knowledge of construction materials and methods, and of architectural techniques to design and oversee building construction.

An architect will discuss the purpose, requirements and cost of a project with the client and then prepare drawings. If these are accepted, the final design is prepared together with working drawings for the use of contractors. The architect may assist the client in selecting a contractor. During construction, the architect may visit the site to ensure that the design is being followed. Architects may also help in selecting building sites, preparing cost and land-use studies, and carrying out long-range planning for site development.

ARCHITECTURAL TECHNOLOGIST

An architectural technologist is the practical executor of the architect's conceptual designs. Most of his time is spent at the drawing board, but he is also expected to assist the architect in a number of other areas, such as - site surveying -, (which includes preparing measured drawings of existing buildings and collecting practical information relating to the project), - the preparation of presentation drawings and models for the client, detail design, landscape design, the preparation of working drawings for the building contractor and supervision of the building process to ensure that work is progressing as it should.

ART TEACHER

Art teachers help pupils to develop the knowledge, skills and understanding necessary to work in various fields of Art.

They work in schools, technikons, universities and colleges. Art teachers plan lessons according to a curriculum and select the materials needed. They prepare and assign class projects and evaluate the progress of their pupils. Art teachers may also arrange trips to art museums or exhibitions and arrange pupil exhibitions. A school Art teacher will also attend staff meetings and perhaps parent-teacher meetings in the evenings. Art teachers are sometimes expected to teach another school subject in addition to Art.

ARTIST

Artists create a variety of works of art using the media they prefer, such as oil paint or water colour. They decide on a subject or idea for their work and select the supplies they need. They may have to prepare the supplies e.g. by stretching the canvas or mixing paints. Using their own methods they create the work they have in mind.

Some artists create works for their own satisfaction while others undertake commissioned works or portraits. Many artists teach art in schools or other educational institutions or give lessons in their homes or studios. Most artists cannot support themselves solely on the sale of their work but have to hold down other jobs too.

Art is a reflection and an integral part of human history, progress and culture. Artists today, as in the past, reflect, record and comment on our world, our beliefs, our moments of magnificence and failure, our fears and ambitions. The artist skilfully gives physical expression to a vision so that the observer can feel and understand the world in the same way.

CARTOONIST

Cartoonists prepare satirical or humorous cartoons for publication in most of the visual media such as newspapers and magazines.

Cartoonists may create their own characters and may write their own scripts or illustrate the scripts of others. All cartoonists need extensive art experience and many require writing skills too. Political cartoonists also have to keep up to date with politics, economics and social conditions. Television cartoonists should be very versatile and able to produce anything from comic flash cards to animated cartoons.

Cartoonists specialising in advertising must be familiar with selling and advertising techniques and trends as well as with art techniques. The work of a cartoonist can be very stressful because of the need to work to deadline. This is especially true of a political cartoonist working for a daily newspaper.

CERAMIST / CERAMIC DESIGNER

A ceramist designs and produces ceramic objects such as tableware, vases, decorative pots, wall decorations and sculptures. The field spans a range of creative levels from working in a ceramics factory within a fairly rigid framework through producing attractive pottery for the tourist and cottage industries to the highly-creative environment of an individual ceramist creating original ceramic sculptures.

A career in ceramics will appeal to those who enjoy creating artistic solutions to practical problems. This career involves working with one's hands and handling various materials and the ceramist must master a number of skills including clay selection and preparation; forming the clay by hand-sculpting, wheel-throwing, coiling, press-moulding and slip-casting; decorating articles by texturing, carving or painting; and firing by any one of a number of methods which range from the extremely simple to the highly sophisticated.

CLOTHING DESIGNER

Clothing designers apply their knowledge of style, line, colour, proportion and fabrics to the task of designing clothing. The industry covers a broad spectrum and designers may slot in at various levels of creativity.

It is a very competitive field and only a few designers become trend setting fashion leaders, who are drawn from the ranks of couturiers and custom-designers. Most clothing designers are employed by factories manufacturing garments for the mass market.

Fashion styling falls into this field, too, and, entails the selection and adaptation of high-fashion garments for lower-budget production for the mass market. Designers may also specialise in certain types of clothing, such as footwear, hats or sportswear.

COLOUR CONSULTANT

A colour consultant is a person who has exceptional skills in using colour to maximum effect. His primary function is to advise interior designers, architects, textile manufacturers and private domestic clients on the effective use of colour.

Colour consultants are often asked to co-ordinate the colour scheme for a whole job. The degree of freedom that they have will depend entirely on the client. It is therefore important that a colour consultant listens to the client's instructions carefully and interprets them accurately.

In addition to familiarity with colour theory, colour consultants require sound technical knowledge of dyes, fabrics, fabric production processes, paints and surface treatments (such as different wall and ceiling finishes).

COSTUME DESIGNER

The task of a costume designer is to design the costumes for live performances and television and film productions. It is the costume designer's responsibility to ensure that the period of the performance is accurately reflected in the costumes, right down to the last accessory, including hats, shoes, gloves and even hairstyles.

Costume designers need to be able to work creatively within certain restrictions. Some period costumes need to look heavy, yet should be designed in such a way to allow the actors to move freely. This is especially important when action such as dancing or fencing forms part of the performance. The designer also needs knowledge of fabrics in order to create the feel of a period.

Costume designers working for small companies will need to do the cutting and machining themselves. This will be done by specialists in a large company, but the designer needs to supervise the process and take responsibility for the final product.

DISPLAY ARTIST

Merchandise displayers design and install shop and shop window displays in an attractive and eye-catching manner. A theme is chosen and then the necessary properties (such as lights, mannequins and background scenes) are obtained or constructed and installed. In addition, previous displays have to be dismantled.

In small shops, one displayer may perform all the tasks, while in larger shops they may specialise in such activities as carpentry, painting, signwriting, interior or exterior displays or administration.

The display artist should construct window displays or dress counters in such a way that products catch the eye of the potential buyer. The work of the display artist is thus an important part of merchandise marketing.

DRAMA TEACHER

Drama teachers instruct individuals and groups in the techniques and principles of acting. Pupils are evaluated and a course of study is then adapted to meet individual needs and abilities.

Instruction may include diction, enunciation, voice development and accents as well as movement, acting styles and character development. Drama teachers may produce and direct plays for school and public performances and this will include the supervision of make-up, costumes, scenery and lighting.

Drama teachers may also be involve in other school activities such as sport and fund-raising, and may also visit pupils at home and have discussions with parents.

FASHION ARTIST

Fashion artists are the commercial artists who create clothing advertisements for newspapers, magazines and television spots.

They illustrate brochures, pamphlets and catalogues. They sketch the new fashions shown in photographs or worn by mannequins or live models in such a way as to attract the attention of readers or viewers and stimulate their interest in purchasing the garment.

Fashion artists must pay special attention to small details that may easily be overlooked, since these are the very things that may make the garment more attractive to the buying public. Since they constantly strive to see fashion in original and interesting ways fashion artists often work with advertising staff to develop new approaches to promotion.

FASHION DESIGNER

Fashion designers create clothes which can be produced within a certain price range and in keeping with current styles and trends. Their ideas for styles come from scanning trade publications, visiting shops, travelling and observing lifestyles.

Designers develop and record their ideas by making sketches, draping dummies or making patterns. They select colours, fabric and trimming for their designs. Next they prepare samples or model garments which are then checked carefully for appearance, fit and quality of work and if they are accepted the samples are included in their lines and presented to sales personnel or private clients. Some fashion designers run their own businesses.

GRAPHIC DESIGNER

Graphic designers create the original design work and final artwork used for newspaper and magazine advertisements, hoardings, pamphlets, posters, package designs, catalogues, greeting cards and brochures. They are also involved in the television and film industry. Here they have a major input in the production of advertisements, films, documentary programmes, etc. They also design book covers, calendars, letterheads and labels.

The graphic designer is instructed by the employer or commissioned by a client to undertake a particular assignment, analyses the employer's or client's needs and advises on the most effective methods of meeting those needs, keeping market trends in mind.

INTERIOR DECORATOR

An interior decorator designs, plans and furnishes the interiors of public and private buildings.

A decorator considers the use to which the area will be put, as well as the budget and the taste of the client, and then sketches plans for the client's approval and modifies them if necessary. After obtaining the client's approval the interior decorator buys the furnishings and supervises the work.

Decorators in shops advise buyers and executives on style and colour trends in interior furnishings. Some interior decorators also design furniture to be used in various settings and a few work on film or television.

JEWELLER GOLDSMITH

The jeweller or goldsmith is a trained craftsman who designs and manufactures jewellery. He utilises metals such as gold, silver or platinum and precious and semi-precious stones. Craftwork production entails the making of individual articles by hand by skilled craftsmen whereas mass production entails the use of moulds and machines to produce articles.

Jewellers and goldsmiths make and repair rings, necklaces, earrings and other jewellery. They make moulds to cast mass-produced jewellery or dies to stamp it and carry out the finishing work, such as setting stones and engraving. Typical alterations and repair jobs involve enlarging or reducing the size of rings, resetting stones and replacing broken clasps and mountings. Some jewellers or goldsmiths repair watches and do hand-engraving. Qualified gemmologists appraise precious and semi-precious stones.

LANDSCAPE ARCHITECT LANDSCAPE TECHNOLOGIST

Landscape architects or technologists design outdoor spaces to make them functional and attractive. These spaces may range in size from small privately owned gardens to city squares and parks.

Landscape architects or technologists first study the geography of the project site, examining the slope of the land, the trees present and the distribution of shade and sun. Preliminary plans and budgets are then drawn up after consultation with engineers, project architects, horticulturists and municipal officials. After plans have been approved final drawings are prepared showing existing and proposed features, lists of all materials needed are drawn up. Finally contractors are invited to submit tenders for carrying out the work.

MAKE-UP ARTIST

Make-up artists apply cosmetics, powder, paint or grease paint to the faces of actors before they appear on stage or in front of the cameras. They also carry out research on design, creation of character, period make-up and hairstyles for studio dramas, live theatre and film shots.

They consider the shape of the face, the bone structure, the form of the eyes and the complexion before applying the make-up. Special effects are created by tinting and bleaching the hair, making up and applying beards, moustaches and wigs, etc. They also use colouring materials, padding and prosthetic pieces to simulate wounds, cuts, scars and bruises or to create monstrous faces and hands.

They are required to remain on duty during productions to touch up actors' make-up. A specialist in special effects and prosthetics may become a make-up designer.

MUSIC TEACHER

Music teachers give instruction in instrumental and or vocal music to people of all ages. They may teach popular or classical music to serious students and those who are studying music as a hobby. Some teachers give private lessons while others teach in public or private schools, colleges or universities.

In addition to teaching students to play certain instruments or to sing, they may teach the various theoretical components. Rudiments of Music, Harmony, Counterpoint, Musical Form, History of Music (general musical knowledge and musical appreciation) and instrumentation (and orchestration). Music teachers in educational institutions may also conduct choirs, school bands and orchestras.

A school music teacher will also attend staff meetings and perhaps parent-teacher meetings in the evenings and may be expected to teach another school subject in addition to Music. They may also be required to help with other school activities such as sports and educational tours.

MUSICIAN

Musicians perform for the purpose of entertaining. The nature of a musician's work can vary considerably, depending on the field of specialisation. (1) composers write or improvise musical compositions, thus translating their own creations of melody and harmony into musical signs and symbols for others. (2) performers study music scores carefully and rehearse them until they are played perfectly before appearing in public as soloists, accompanists or members of orchestras. They have to tune their instruments to the proper pitch and may play from memory or from sheet music; (3) conductors study the selected music and preparing themselves to conduct a band or orchestra; (4) music teachers give lessons either at a training institution such as a school or privately.

PATTERN-MAKER (CLOTHES)

The main function of a pattern-maker is to translate the fashion designer's design into a pattern. First of all the initial working sketch is made from the design. After the pattern has been sketched and the specifications outlined, a sample garment is made up. A master pattern is then prepared and the pattern is graded into different sizes.

Pattern-makers work in conjunction with boutiques and clothing factories.

PHOTOGRAPHER

Photographers use cameras to portray people, places, objects and events. Most photographers specialise but their basic equipment is the same. Using their knowledge of design and composition, they select images to obtain the effect they want.

Press photographers take pictures of fires, accidents, prominent people, sports and other subjects of interest. They do not usually pose their subjects and they have to work against time. Scientific photographers photograph visible objects or events, or use special equipment to photograph information not normally visible; they usually work in research institutes and hospitals. A studio photographer works in a studio and takes photographs for passports, identity documents, formal portraits and wedding photographs. A forensic photographer takes photographs of crime scenes -- for instance, the scene of a murder -- in order to help detectives solve the crime. An advertising photographer takes photographs of people or objects for use in advertisements. A fashion photographer usually works for magazines and takes photographs of models displaying clothes.

The work of a photographer contains two basic elements: - the taking of a photograph and its development and printing. Photographers often work in more than one field of photography.

PHOTOJOURNALIST

The modern photographer is a combination of an artist and a scientist who has to master the use of sophisticated equipment and development processes as well as see in a perceptive way.

Photojournalists specialise in one aspect of photography -- they photograph newsworthy events, people, or other illustrative or educational material for use in publications or telecasts, using still cameras. They normally have to travel to different and sometimes dangerous locations, for example to cover natural disasters or military conflicts. The photojournalist needs to understand the story behind the 'on-the spot news' - and needs to be able to portray this in a series of photographs which form a visual statement or essay.

Photojournalists can also diversify into publishing photographic books, calendars, postcards and posters.

PRESS PHOTOGRAPHER

The main function of a press photographer is to photograph newsworthy events. Dramatic front-page news photographs sell newspapers, so press photography presents particular demands to the photographer. The pictures need to have a sense of immediacy and to portray the essence of a situation in usually no more than one shot. Press photographers therefore need to be able to get to situations quickly, since newspaper deadlines are very pressing and the photographs have to be prepared for publication. The press photographer will often be called upon to produce usable images under tough conditions.

PRODUCER - FILM AND TV

Producers plan and co-ordinate the practical organisational aspects of a film or television production. They set up auditions for actors and control the securing of costumes, props and other equipment. Producers co-ordinate the sound, scenes, music, camera work, timing and modifications to the script. They instruct the actors and crew regarding the timetable and rehearsals and see that the production runs to schedule. Ensuring that the production does not run over budget is also their responsibility. They negotiate staff contracts, authorise the payment of salaries and arrange publicity for the production.

Essentially the producer frees the director to concentrate on the artistic aspects of the film -- the two occupations are complementary.

PROFFESSIONAL DANCER

This term covers a range of different styles of dancing, including classical ballet, modern, acrobatic, aerobic, mime, night-club and ball-room.

Many a young girl dreams of becoming a ballet dancer. The dream, however, rarely encompasses the reality of the self-discipline required and the rigorous and arduous ballet lessons and rehearsals every day, - including weekends and holidays. This is a strenuous career and its demand for physical perfection entails a constant concern with diet, weight, fitness and health.

The rigorous and early training required, the short duration of a career and the strong competition for jobs make this a career for the very dedicated. Ballet training for girls usually begins at five to eight years of age and for boys between ten and fifteen. Training in modern dance does not have to begin as early as this. The physical demands of professional dancing force most dancers to stop performing by their late thirties, but many continue to work in the field as choreographers, dance teachers or artistic directors.

RADIO PROGRAMME WRITER

Radio programme writers work in all areas of the radio field. They often take the news from the wire services and edit or rewrite new stories for local broadcasters.

Radio programme writers also produce story scripts, organising various materials and writing each story to conform to length and format requirements. If necessary, they edit and rewrite story material. Radio programme writers also create feature scripts for the news staff and sometimes develop commercials for sponsors. Radio programme writers generally work for radio networks while there are many freelance radio script writers.

SINGER

Singers perform either as soloists or as members of a vocal ensemble to entertain a variety of audiences. They interpret music using their knowledge of harmony, rhythm and voice. They follow or memorise printed text and musical notation and may sing a cappella or with instrumental accompaniment.

Some singers make recordings or go on concert tours while others perform in operas, musicals or appear as concert soloists. Singers may sing in films, on stage, on radio and television, in night-clubs and in other places of entertainment. Some singers may teach and direct choirs or give private voice lessons. Singers are known according to voice range as soprano, contralto, bass, baritone or tenor and are often expected to be able to act, dance or play an musical instrument.

STAGE MANAGER

Stage managers are responsible for ensuring that theatre productions run according to plan. They ensure that performers are prepared and waiting in the wings in time for their scheduled appearances.

They also ensure that set changes, sound and lighting run according to plan. This is an extremely responsible position with actors and technicians reporting to the stage manager, who is assisted by an assistant stage manager, a props master/mistress, stage hands, a wardrobe master/mistress and dressers and works closely with the director, sound and lighting technicians and technical manager.

TAXIDERMIST

A taxidermist preserves, stuffs and mounts animal skins for display in museums or private collections and study collections. He uses his artistic ability and knowledge of the technical processes to create a preserved animal that looks as life-like as possible. Taxidermy methods have changed considerably through the ages.

Today, extensive use is made of dermosculpture, which entails making a plaster of Paris mould, fitting the tanned damp skin over the cast, gluing it and keeping it in place during the drying process by means of pins and various methods of bandaging. A recent advance in taxidermy is the freeze-drying method, where the animal is placed in a life-like position and frozen; the moisture is then vacuum-extracted from the frozen specimen. This method is usually combined with more traditional methods. The most successful method of preserving fish, reptiles and invertebrates is to create a plaster of Paris mould which the taxidermist paints to look life-like.

Taxidermists need to draw extensively on nature to achieve realistic work, for example animal anatomy, natural poses and positions of animals and birds and natural-looking skin colours. They are sometimes called upon to do fieldwork to collect animal and bird specimens.

TEXTILE DESIGNER

The main function of a textile designer is to create and develop designs which are either woven or knitted into or printed onto textiles. A textile designer requires artistic skill and a sound knowledge of fabric characteristics and factory reproduction techniques to design exquisite and marketable textiles.

These designers are mostly employed by the fashion-fabrics and home-textiles industries. It is sometimes expected from textile designers to travel from one country to another to study fashion trends.

TOWN AND REGIONAL PLANNER

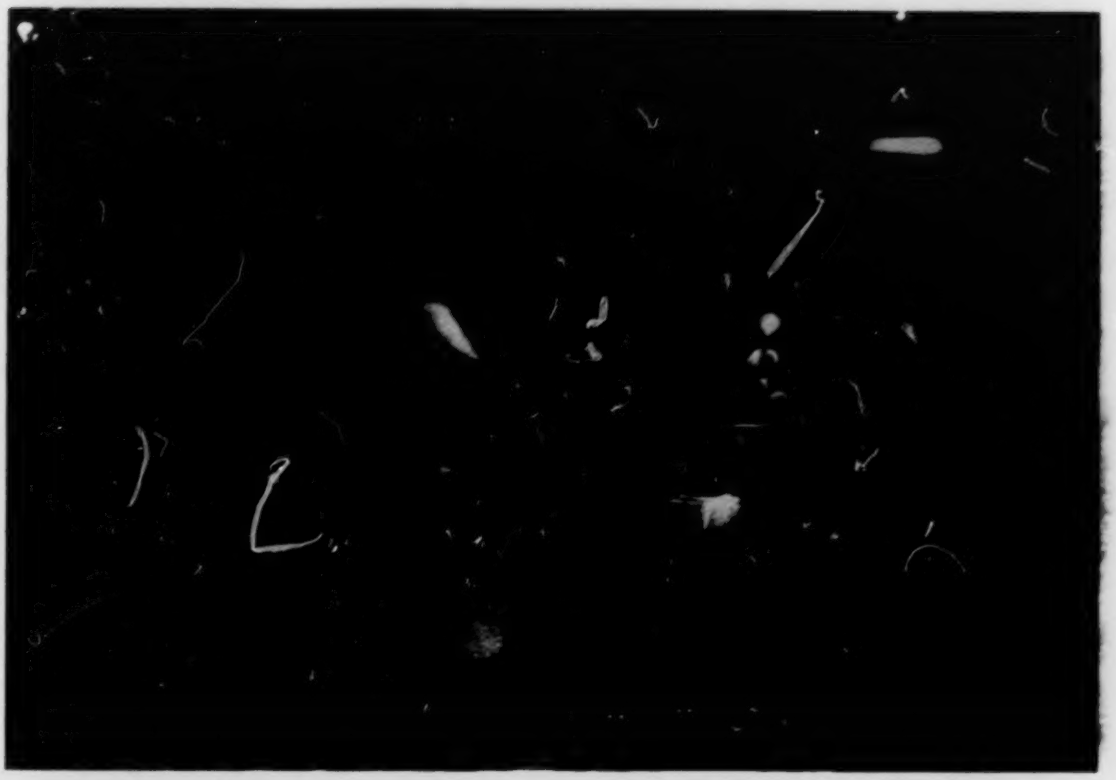
Town and regional planners develop, at many scales from regional to neighbourhood level, programmes for the most advantageous and purposeful development of towns, cities and rural areas. The work of the town and regional planner is focused on improving the living conditions of people.

They estimate future needs for housing, business and industrial sites, community facilities and open spaces in order to meet the needs of expansion and renewal. They further investigate the nature and extent of problems concerning prospective development such as projecting future needs in traffic and transportation. They must keep up with legal issues involving community development and changes in housing and building codes.

Most of his work is done in an office but he also need to go out to see whether everything is done according to the proposed development plan. He works closely with architects, engineers, economists, sociologists, administrators and management.

VIDEO EDITOR

The main responsibility of a video editor is to turn rough video footage into a finished and polished video ready for screening on television. Working very closely with film producers, video editors use their knowledge of continuity, camera angles and television pacing-, to create mood, pace and timing. The



StudentPlan - we can't take the hard work out of studying

but we can take the hassle out of banking.

My folks said I had it really easy, that in their day things were tougher. Huh, there I was, filled with dreams, burning with ambition and working every night. And with this sinking feeling that I would never have enough money to do it all.

My folks bank at the Standard, so that's where I went. Boy was I surprised. The Standard don't just offer student loans for university and technikon studies, they offer a complete package.

I got a Student Loan at a preferential rate and a Student PlusPlan Account that earns more interest as I save, free of any service fees provided I use Standard Bank ATMs. What's more, my accounts are linked electronically and with my AutoBank card I can do my banking at any time, anywhere at any ATM. I'm impressed. In fact next year I plan to make use of their vehicle finance facility at a preferential rate.

There's only one problem though; all this means my folks were right!

For more information call 0800 12 1000.

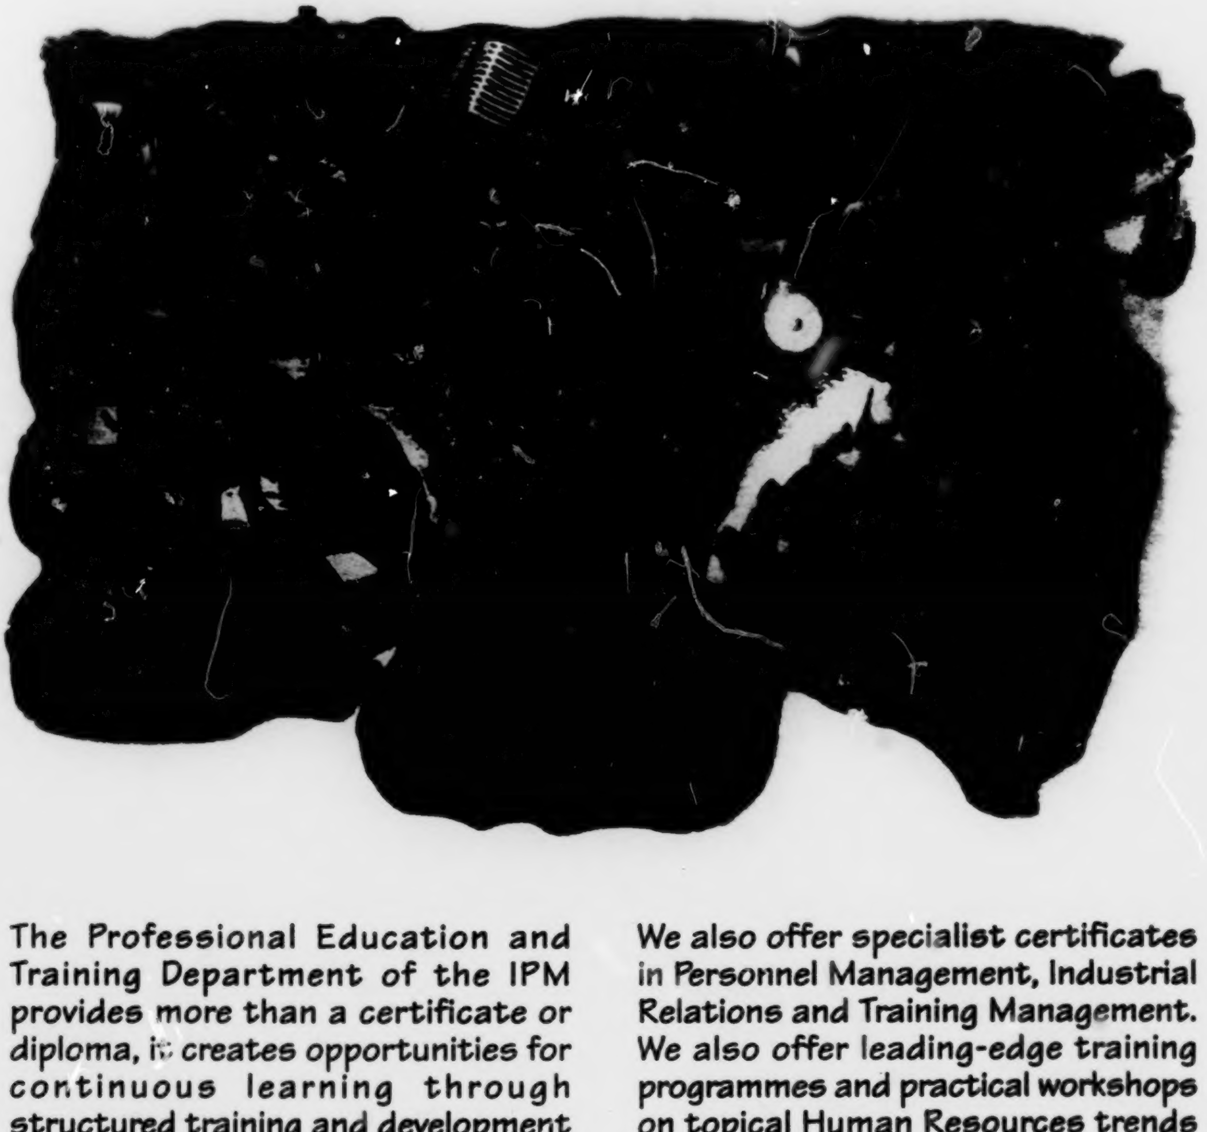
At the center of people development



The Professional Education and Training Department of the IPM provides more than a certificate or diploma, it creates opportunities for continuous learning through structured training and development programmes and by facilitating networking and advancement opportunities.

In the Education field the IPM Diploma in Personnel Management is recognized and accredited by the Human Science Research Council on a Matric plus three year level (M+3).

We also offer specialist certificates in Personnel Management, Industrial Relations and Training Management. We also offer leading-edge training programmes and practical workshops on topical Human Resources trends and corporate solutions through customized in-house training.

If you'd like to know more about these courses call us on (011) 482-4970.

STUDENT'S GUIDE TO HIGHER EDUCATION IN SOUTH AFRICA 1998

- Everything a school leaver needs to know about making a decision to get tertiary training
- Information on how to choose a career
- Short descriptions on occupations according to field of interest
- Comprehensive course information on universities, technikons, technical and private colleges
- Address details for all categories of tertiary institutions
- A list of bursaries available
- Useful indexes to occupations, fields of study and bursaries
- Information updated and published annually

STUDENT'S GUIDE TO DISTANCE EDUCATION IN SOUTH AFRICA 1998

- A comprehensive guide to distance courses and institutions
- Comprehensive course information for distance learning institutions
- Address details for distance learning institutions
- Useful indexes to fields of study and distance institutions showing courses listed
- Information updated and published annually

video editor cuts footage that is not going to be used and ensures that the film still flows sensibly. He or she also generates digital effects, adds graphics and titles and prepares the soundtrack for audio final mixing.

WEAVER

There are two types of weavers hand weavers and operators of mechanised weaving machines. Hand weavers weave cloth on table or floor looms. They need to have sufficient knowledge of the weaving process to enable them to control the quality of the final product. Hand weavers can work either to specific instructions in a factory-type setting or they can work independently as artistic weavers, creating their own designs.

Weavers who operate automated weaving machines in textile factories need to acquire expertise in operating the automated machinery. The tasks they perform include observing the machine-weaving process for defects, removing defects in the cloth by cutting and pulling out filling, examining automated looms to determine the causes of stoppages, marking or cutting cloth to specified lengths and replacing bobbins on non-automatic looms.

WOODCARVER

Although much of the work previously done by hand is now done by machine, some tasks still require the skill and ingenuity of the woodcarver. Woodcarvers carve beautiful images and designs into selected pieces of furniture. They design and carve lyre-backed chairs, ball-and-claw feet for tables and chairs, ribbon-festooned aprons of tables, drawer fronts of chests, tea coasters and the like.

Woodcarvers mark with chalk those pieces of wood which must be cut away. Here the woodcarver must work carefully so that he does not cut away too much wood. They lay the article on a workbench or clamp it firmly in a bench vice and slowly cut and chisel away the wood. They finish the articles by sand papering them carefully and staining or varnishing them.

Education & Social Service

ADULT EDUCATOR

There are essentially four different areas in which an adult educator works. The first is that of professional development where qualified workers are taught new approaches, informed of new developments and legislation or shown how to improve certain aspects of their jobs. Large corporations often perform this type of adult education through their established training departments. Adult educators working in this area have usually become experts in a particular area.

The second area is that of adult basic education and further study where adults attend literacy classes and study part-time or full-time to improve their qualifications. Such courses are offered by community centres, religious institutions, non-governmental organisations geared to this purpose, professional institutes, business colleges, universities and technical colleges. Literacy may be taught by anyone who is competent in the language being used and who has teaching ability -- primary-school teachers are ideally suited to this task. High-school teachers are needed to prepare students for Std 8 (Grade 10) or Matric (Grade 12) and educators teaching career-related courses need to have passed the courses themselves and have worked in the appropriate fields.

The third area of adult education is that of skills development. Skills training ranges from personal-growth skills, such as assertiveness and time management, to skills required for economic survival, such as home industries and job-hunting. People in the caring professions -- nurses, social workers and psychologists -- are ideally suited to carrying out this type of training, but such a background is not essential since these skills can be taught by anyone who has had to develop them to run their own lives.

The fourth area in which adult educators work is that of enrichment, where people join classes in subjects such as dancing, flower-arranging and creative writing purely for personal enrichment. Adult educators in this area are people who have made a special study of a subject or who have achieved success or recognition in a certain field.

ARCHIVIST

An archivist is responsible for the care and preservation of valuable materials which could include documents, maps, photographs, microfilm, films, video tapes and sound recordings. The archivist also has to store these materials in such a way that they are easily accessible.

Since many of the materials in an archivist's care are irreplaceable, proper preservation of them is probably the most important part of the job. Archivists need to keep abreast of the latest techniques to guard against various hazards. They need to file and index the material so that it is easily accessible to researchers. Record management, (control of material kept in its office of origin), and regular evaluation of the material to determine whether it is of temporary or permanent significance is also part of archival work. Another aspect of the job involves the publication or dissemination of information to scholars and other potential researchers in order to familiarise them with the archives in the archivist's custody.

ART TEACHER

- see page 8

BEAUTY TECHNOLOGIST / SOMATOLOGIST

Somatologists (beauty technologists) are concerned with the treatment and prevention of disorders involving the skin and body. They are interested in the overall health and well-being of people. The activities of a somatologist include - assessing and treating skin and figure problems; - recommending and carrying out slimming treatments and exercises in conjunction with a diet recommended by the client's doctor; - cosmetic sales; - specialised make-up techniques; - and permanent and temporary removal of unwanted facial and body hair. They use massage and modern apparatus in close co-operation with dieticians, dermatologists and medical practitioners.

Interest in the holistic approach to body and mind has led to recent changes to the curriculum of this course. The course now places greater emphasis on physical education, nutrition and stress management and less on aesthetic treatments such as make-up.

CLERGYMAN / MINISTER

Clergymen or ministers attend to the spiritual and moral needs of their congregations. They deliver sermons, lead services of worship and administer such sacraments as baptism and holy communion. They conduct weddings, funerals, confirmation and other religious ceremonies. They provide instruction to individuals interested in joining the church and counsel those seeking guidance. Visits to the sick, elderly, handicapped and bereaved are also part of their work. Many clergymen engage in community, civic, educational and recreational activities sponsored by or related to the church. They also have administrative duties such as writing testimonials for members of their congregation. Some of them are ex-officio members of clerical bodies where the joint activities of the church are managed.

DRAMA TEACHER

- see page 9

FITNESS / HEALTH CONSULTANT

Health and fitness consultants assess the physical health and fitness levels of their clients and, on the basis of this assessment, offer advice on lifestyle changes to improve fitness and general health and well-being.

In the initial evaluation, the health and fitness consultant will conduct physical tests such as measurements of pulse, heart rate and weight. The consultant will also evaluate the client's general state of well-being by inquiring into such matters as stress, eating habits, illnesses and physical activity. The consultant will then recommend a lifestyle plan for the client which will address aspects such as diet, an exercise programme and stress management.

HOME ECONOMICS TEACHER

Home economics teachers instruct individuals in subjects related to family living and home-making. They teach nutrition, clothing and textiles, family relations and similar subjects in schools, colleges, technikons and universities. Some of them provide extension courses on an informal basis to women, churches, welfare and youth organisations, immigrant groups and government departments. Such extension courses involve lectures, demonstrations, exhibitions and group discussions.

Home economics teachers are also called upon to set and mark examination papers, and may be required to participate in school fund-raising and sport activities and in parent and pupil liaison.

HOME ECONOMIST

Home economists are concerned with domestic living and they work to improve products and practices that affect almost everyone in our society.

Most home economists teach in various types of educational institutions. Some work closely with the media to promote products. Others conduct research in an area of personal interest within the broader field of Home Economics. They also work as interior decorators and in the catering field. The nature of the work depends on the type of post the home economist is employed in.

LIBRARIAN AND INFORMATION WORKER

The basic function of the librarian and information worker is not only to select, acquire and organise a vast amount of information, but also to make this information and these sources available as efficiently as possible and wherever needed.

Libraries have the following departments ordering or acquisition, cataloguing and classification, lending or circulation and information or reference. In large libraries and information services the various tasks may be handled in separate departments, but in small libraries all the work is usually performed by the same staff.

Every library has to select the books and other material it needs and then order whatever is needed from local or foreign sources. Upon receipt the material is handed to the cataloguing and classification department where it is carefully analysed to determine its contents so that it can be indexed properly.

A direct service to the user consists of the answering of inquiries. The staff responsible for reader advisory services could be known as reference librarians (attending to general reference questions), subject reference librarians (responsible for a related group of subjects) or subject specialists (responsible for services to readers to a particular subject). Books and periodicals normally form the major part of library acquisitions.

There are also various libraries aimed at a certain type of user, such as public libraries, university and college libraries and school libraries and information services serving individual research institutions, government departments, commercial firms, organisations and associations.

MUSIC TEACHER

– see page 9

PRE-PRIMARY SCHOOL TEACHER

Pre-primary school teachers lead small children in activities designed to promote social, physical and intellectual growth. They also teach personal hygiene, music, art and literature.

They introduce children to the basic elements of mathematics, language, science and social relationships. They organise and supervise activities such as games, group activities and dramatic play acting and encourage children in singing, dancing and in the use of art materials. They see that children have rest periods, and watch for signs of illness or other problems. Pre-primary school teachers evaluate the progress of the children in their care and discuss this with parents.

PRIMARY SCHOOL TEACHER

Primary school teachers impart knowledge to children and, by understanding their needs, guide them through the various developmental stages. They teach their pupils the basic concepts of mathematics, languages and science. They may use audio-visual aids to present subject matter.

In addition to actual teaching they prepare lessons according to a curriculum prescribed by the relevant education department. Primary school teachers are also expected to help with extra-curricular activities such as sports, concerts, film shows and fund-raising efforts. Teachers have to do such administrative work as filling in attendance registers, keeping records of children's progress and setting, and marking homework and examinations.

REMEDIAL TEACHER

Remedial teachers therapeutically assist pupils to overcome their specific learning disabilities. Children with specific learning disabilities usually have average or above-average intelligence but cannot cope effectively with certain aspects of school work. These disabilities emerge for example, as an inability to integrate letters into words, reversal of words and numbers, misspelling of words and an inability to do arithmetic.

Remedial teachers usually start their investigation by scrutinising children's work books for indications of their problems. They then test the children to verify or to diagnose the problem. To remedy the inability they make use of various remedial aids and methods. They advise teachers and parents on ways to help these children.

SCHOOL COUNSELLOR

The primary responsibility of a school counsellor is to supply high-school children with career information, and to help them gain the self-knowledge and equip them with decision-making skills which will allow them to make appropriate career choices. Counsellors devote a large part of their time and energy to administering and evaluating aptitude tests and interest questionnaires, the results of which they pass on to pupils, in a suitable form so as to assist them in understanding their capabilities.

Another area in which school counsellors are of help is in the emotional development of pupils. This can be done on a one-to-one basis where necessary; in this situation the counsellor may liaise with the pupil's parents and other teachers. Emotional development can also be dealt with on a group basis with sessions addressing issues such as drugs and Aids. Counsellors are also expected to initiate appropriate measures for pupils with learning problems.

SECONDARY (HIGH) SCHOOL TEACHER

The secondary school teacher educates pupils in Standards 6 to 10 (Grades 8 to 12). The teacher follows the syllabus of work laid down by the relevant education department and the subject teachers at the school in order to prepare pupils for examinations.

Secondary school teachers teach pupils the subjects they have selected. They use various teaching methods and demonstrations in their lessons as well as audio-visual aids. They prepare teaching outlines, assign tasks and correct homework and also give tests in order to evaluate progress, record results and issue progress reports to parents. Secondary school teachers keep attendance records and maintain discipline and also participate in departmental and professional meetings and educational conferences. They may coach pupils in various kinds of sports and cultural activities during the afternoons and may be responsible for special activities or school societies.

SOCIAL WORKER

Social workers help people of all ages to cope with the problems caused by poverty, unemployment, illness, antisocial behaviour and other social inadequacies.

Social workers practise in the fields of child and family welfare, marriage and divorce counselling, care of the elderly, medical social work, psychiatric social work, social work with the mentally or physically disabled, social work with alcoholics and drug dependants, social work with criminal offenders, and social work in the workplace or school.

The social worker use various working methods, often in combination: (1) case work - case workers set up one-to-one relationships with individuals, visiting them to give them personal assistance and encouragement; (2) group work - group workers organise group activities for people sharing similar problems, interests and needs -- the organisation of recreational activities for the elderly is but one example; (3) community work - community organisation workers identify needs in the community and help plan and develop health, housing, rehabilitation and other welfare services.

SPECIAL EDUCATION TEACHER

Special education teachers instruct children who have special educational needs. This may include children who are learning disabled, blind, deaf, or mentally or physically handicapped.

Special education teachers observe pupils individually so as to understand each one's psychology and characteristics. Specific teaching techniques and curricula using special teaching skills are then selected and applied so as to meet each pupil's needs and suitable materials and equipment are selected or developed in each case. Special education teachers must also observe the behaviour and progress of each pupil and report on this to the school authorities. These teachers usually work closely with the parents of handicapped children to help them understand and look after their children.

The special education teacher forms part of a broader team of psychologists, social workers, occupational therapists, school counsellors and medical personnel, all of whom are geared to help the pupil overcome or cope with disability.

SPORTS ADMINISTRATOR / SPORT ADVANCEMENT OFFICER

Sports administrators regulate, plan and promote sporting and recreational activities. They make contact with other sports organisations in order to plan and co-ordinate such activities.

They attend sporting tournaments, training courses and meetings where the administrative aspects of sports meetings and events are dealt with. They organise coaching sessions for trainers and leaders in sports and recreation, as well as special sports events and fitness schemes.

They may help plan and design sporting and recreation complexes, and do research in the field of training, fitness, diet, equipment and apparatus. They also participate in the process of conflict resolution between sporting organisations or individual sportsmen and women.

TRAINING OFFICER

Training officers prepare and conduct training programmes for employees in industry, commerce, or government. The main aim of this training is to develop the workers' skills and to improve their productivity.

Training officers meet with management and study job operations so as to understand the demands of the actual work situations for which employees require training. They then select teaching aids such as textbooks or manuals, demonstration models and visual aids, and schedule the training sessions. Training officers also conduct specialised training sessions, on-the-job training and apprenticeship programmes. They finally test the trainees to measure progress and sometimes advise on further study at a technikon or university.

Entertainment/Performing arts

ACTOR / ACTRESS

– see page 8

DISC JOCKEY

A disc jockey is an announcer on a musical radio programme who selects the music to be played on the basis of the programme speciality and listeners' tastes. Disc jockeys also comment on the music selected and provide listeners with interesting snippets of information about some of the selections and recording artists involved. They may also comment on general matters such as the weather and traffic conditions, and give time-checks and run station promotions and competitions. Disc jockeys sometimes interview recording artists and, depending on the structure of their programmes, may run phone-in or write-in requests. Some disc jockeys also perform at night-clubs.

Hand Crafts (handwork) & Services

AROMATHERAPIST

Aromatherapy is a branch of both holistic medicine and beauty therapy. It entails massaging the body with essential aromatic oils, each of which has different properties -- some stimulate, others soothe. Clients discuss their specific problems with an aromatherapist who then selects the correct oil or oils for treatment. The oils have to be mixed with a carrier oil (pure vegetable oils) because they are highly concentrated. The object of the treatment is to detoxify the body and to calm and relax the client.

BAKERY TECHNOLOGIST

Bakery technologists apply their knowledge of chemistry, biochemistry, microbiology and bakery technology to maintaining and improving the quality of baked products. They are responsible for controlling quality from raw-material stage to end product. This entails testing products at various stages of processing.

The job also involves conducting research into improving baking methods for mass consumption and developing more efficient ways of storing, packing and distributing products to eliminate spoilage. In addition, bakery technologists are responsible for training production staff in the various aspects of bakery technology and supervising them to ensure proper application of the techniques.

CATERER

Caterers provide food and refreshments plus the necessary serving utensils and related items for luncheons, wedding receptions, and other large gatherings. Perhaps more importantly, they help clients to plan such social gatherings, set reasonable limits on the guest lists, plan the details of the menus and stay within their budgets.

Caterers supervise workers who prepare and serve the food and refreshments, and may also help to prepare the food themselves. They plan the arrangement of tables so that guests will not be crowded as they serve themselves at buffets or sit down to enjoy their meals. Caterers may also arrange to hire bartenders and to provide entertainment for these gatherings.

Caterers own and often manage public dining establishments or restaurants, dining rooms and cafeterias in hotels, department stores, factories, schools and hospitals. In this context caterers, cooks, bartenders and chefs work as a team.

CHEF

Chefs supervise and co-ordinate the activities of the other cooks and kitchen helpers who are engaged in the preparation and cooking of food. They estimate the amount of food needed, purchase the food supplies and check for food quality. They also plan menus. When the food is prepared, chefs give instructions on the sizes of the portions and supervise in the arrangement of the food on the platters and plates. Many chefs hire and train the cooks who work in the kitchen. The chef is also responsible for the cleaning of the kitchen and ensures that high-quality of service and food are provided at all times.

HAIRDRESSER

Hairdressers cut and style hair according to customers' requests. They also trim, shape, shampoo and tint or bleach hair. They give scalp treatments and massages, and permanent waves. They also trim and style beards and moustaches and may advise customers on personal grooming and cosmetic aids available and some hairdressers fit and style wigs. Usually hairdressers are assigned to a work area which has a customer chair and an area where equipment such as combs, rollers and hairdryers is kept and salons must be kept scrupulously clean. Hairdressers who manage or own salons have the responsibility of ordering supplies, keeping records, keeping an appointment book, receiving clients and hiring employees.

HOME ECONOMIST

– see page 11

MEAT-CUTTING TECHNICIAN / BUTCHER

Meat-cutting technicians cut large pieces of meat into serving portions. They also prepare meat products such as sausage or ham. After cutting the meat, they weigh, price, label and pack it.

In retail stores, they may set up displays and wait on customers. They sometimes have to custom-cut to meet their customers' special needs. Meat-cutting technicians are also responsible for selecting meats from wholesalers or abattoirs and for maintaining records and inventories. They must also ensure that the workplace is clean and that they adhere to safety regulations.

PATTERN-MAKER (CLOTHES)

– see page 9

WEAVER

– see page 11

Language

COPYWRITER

Copywriters write advertisements and scripts for TV, film and radio commercials and think up ideas for complete advertising campaigns in all media. They gather information about the product or service and its potential customers.

Once the objectives of a particular assignment have been determined, the copywriter and the art director team up to think out and design a campaign and decide how best the campaign objectives can be achieved by communicating this particular campaign persuasively to the target market.

They may consult other advertising agency specialists and the client. Copywriters also write all types of promotional or informational booklets, sales promotional materials or merchandising campaign materials.

EDITOR

The specific duties of editors are determined by the type of employer.

Editors in book publishing firms decide if a manuscript has the potential to be a successful publication. Once a manuscript has been approved, they arrange for the copyright, decide on the print, production techniques and promotion. In many publishing firms, copy editors check through the text carefully, correcting language and factual errors and sometimes doing extensive rewriting. Magazine editors assign, accept or reject, prepare and sometimes write articles for publication. They supervise the work of other editors, writers, photographers, typesetters and advertising workers. Editors in the newspaper industry work at a hectic pace to meet deadlines. Managing editors are the owners' representatives and set editorial policy.

INTERPRETER

Interpreters help people from different cultures to communicate effectively in spite of language differences by translating orally what one person has said into a language that others can understand. It is important to note that the interpreter differs from the translator because the interpreter concentrates on the spoken language and on the emotions and attitude of the speaker, while the translator deals with the written language.

A distinction is often made between two types of interpreter -- the simultaneous and the consecutive interpreter. Simultaneous interpreters translate a speaker's words into a second language while the words are still being spoken. Consecutive interpreters wait until a speaker pauses, and then translate what has been said up to that point.

Interpreters may work in certain government departments, embassies the and courts. All interpreters should study the cultural, historical and political background of the people whose languages they interpret in order to best understand the meaning of their words. Working conditions are generally excellent. Simultaneous interpreters usually work at international conferences in glass booths that are placed so that the interpreter will have a good view of everything that goes on in the conference hall. Consecutive interpreters work mainly in the court and in the diplomatic field.

JOURNALIST

Journalists gather factual information on subjects of general public interest and set out to write clear, informative reports for publication in newspapers and magazines or for broadcasting over television and radio. A journalist may specialise in print journalism, broadcast journalism or work in both and may cover a specific field (such as crime or the environment) or work on a special assignment. Journalist observe events, conduct interviews and do research to get their information.

Correspondents may live in distant locations and report news by telephone or electronic means. Feature writers cover new developments for a particular department such as sport, politics or human interest. They often supply historical background for current events. Columnists write regular columns filled, for instance, with personal opinions on current events or lively gossip about public figures.

NEWS REPORTER

A news reporter collects and gathers information about newsworthy events in order to write stories for publication or broadcast. News media broadly fall into two categories and reporters will generally specialise in one or the other: print media, which include newspapers, magazines and the related discipline of digital publishing on the World Wide Web and broadcast media, which cover radio and television.

Reporters usually start out by reporting on general news, such as court cases or crime. As they become more experienced they move on to specialised areas such as sport or politics. News reporting offers a wide range of possibilities, depending on the reporter's temperament. One can opt for the high-pressure 'buzz' of a daily newspaper, for feature writing for magazines, for sub-editing and layout or even -- if action is what you really want -- broadcast reporting from war zones.

PUBLISHER

The main responsibility of a book publisher is to decide what to publish. Manuscripts are either submitted by an author, in which case a decision to publish will be based on quality and suitability for the company's publishing list, or they may be commissioned.

Commissioning general books requires an ability accurately to assess trends in the reading market, while commissioning for educational publishing entails maintenance of regular contact with government or university departments, depending on the sector of education, to establish suitable subject areas in which to publish. Once a reading trend or subject area has been identified, the publisher needs to find a suitable author to write the manuscript and must negotiate a publishing contract.

When a book is accepted for publication it is subjected to a process of editing, design, production and marketing. In medium- to large-sized publishing houses, these processes are usually controlled by specialised personnel. The publisher needs, however, to keep in touch throughout the process as budgets, deadlines, publicity and special editorial agreements are ultimately his responsibility.

RADIO AND TELEVISION ANNOUNCER

The duties of a radio and television announcer are determined by the employer.

A radio announcer is a person who communicates by means of the radio to his listeners. He should have an aptitude to communicate with people and especially an invisible audience. He may introduce recorded music, present news and commercials and comment on matters of local interest. Most radio announcers conduct research to prepare programmes which are relevant and meaningful to his audience.

Television announcers usually specialise in specific areas of announcing such as news, sports or the weather, and must be familiar with the chosen area. A staff announcer reads advertisements, introduces live and filmed programmes, identifies stations and makes promotional and public announcements. Some work as announcer- producers and also develop, create, record and produce special radio and television programmes.

RADIO PROGRAMME WRITER

– see page 10

TRANSLATOR

A translator translates written material from one language into another. The type of written material may vary widely and may range from legislation and reports of government commissions to instruction manuals, scientific research papers and recipes.

The translator usually studies the contents and background of the text before commencing with the actual translation. In addition to language skills, translators must also posses wide general knowledge. Some translators may work as terminologists or lexicographers and some may act as interpreters too.

[illegible]

AGRICULTURAL INSPECTOR

The main function of agricultural inspectors is to evaluate the quality and standard of agricultural products. There are three main areas in which they may specialise - plant quality control technician, meat inspector and animal health technician.

Plant quality control technicians are responsible for plant health services, plant and seed control services and analyses services. They control the quality and marking requirements of fresh plant, animal and liquor products and also focus on the control of plant diseases and harmful insects.

The primary function of meat inspectors is to ensure that animals that are slaughtered are fit for human consumption. Their most important duty is to inspect the levels of hygiene and cleanliness in abattoirs.

Animal health technicians (veterinary technicians) assist veterinary surgeons preventing and controlling diseases through a variety of methods, including research into these diseases, and the production of vaccines and dips. They are responsible for ensuring that farmers respect the laws regarding animal health and for informing and guiding farmers in the control of animal diseases.

CAREERS IN THE NAVY

The SA Navy offers a wide range of careers in various fields. This write-up focuses on three officer careers, namely combat, naval and intelligence officer.

Combat officers lead the Navy's combat element and their training focuses on maritime warfare. It is their responsibility to ensure that the Navy's sophisticated computerised weapons and systems are used with maximum efficiency. Naval engineer officers are responsible for designing, developing and supporting the Navy's weapons and electronic and propulsion services. Naval intelligence officers gather and evaluate information regarding the Navy to ensure maximum efficiency of operations and also initiate steps to prevent sensitive information from 'getting into the wrong hands'.

CORRECTIONAL SERVICES OFFICER

Officers in the Department of Correctional Services ensure the safe custody of prisoners as commanded by a court of law from the date of imprisonment until such a person can be released. These officers are also concerned with the training and treatment of prisoners during their imprisonment, and for the relevant administrative work.

The activities of these officers include carrying out duties in a prison, an administrative office, a workshop, a prison hospital or on prison farms and the territory surrounding each prison.

ENVIRONMENTAL HEALTH OFFICER

Environmental health officers are essentially concerned with the effect that various environmental factors have on the health of communities. This can be an exciting and varied career and environmental health officers can apply their basic training to many different fields of interest.

Environmental health officers regularly inspect sanitation and drinking water in rural areas to prevent the spread of diseases such as cholera and typhoid. They are also responsible for issuing the necessary warnings and putting controls in place in the case of malaria and rabies outbreaks. In urban environments they monitor pollution and inspect restaurants, supermarkets and food manufacturers to ensure that standards of hygiene in the storage, packaging and serving of foodstuffs are maintained and that foods for retail are not labelled in a misleading fashion.

These officers are also concerned with a healthy working environment and inspect industries for problems such as asbestos and other dusts, heat or cold stress, noise, chemicals and high and low pressure in the case of divers and pilots. Another aspect of this career is port control where health officers control entry from ships and aircraft to ensure that contagious diseases are not brought into the country.

FIREMAN

Firemen protect life and property from fire and attempt to prevent the outbreak of fires. They also give assistance in the event of disasters such as earthquakes, train derailments, vehicle accidents, floods and so forth.

Procedures for extinguishing fires or for handling disasters such as vehicle accidents are mostly planned and practised beforehand. However, upon arrival at the scene it remains necessary to decide upon suitable techniques, for instance whether to use water hoses or chemicals to extinguish a fire.

Firemen also carry out routine tasks such as cleaning fire engines, polishing equipment and working in the radio room. They attend lectures, demonstrations and practical training sessions. Firemen who are employed at airports, must be distinguished from ordinary firemen. They provide effective fire protection for aeroplanes and buildings and also perform specialised emergency and rescue services.

INSPECTOR OF WORKS

An inspector of works ensures that the structural, mechanical and electrical aspects of building construction are carried out according to plan and specifications and conform to required standards.

Their duties are varied and are determined by their specific employers. They draw up specifications and lists of materials for new works and building repairs, refurbishments and extensions. They carry out inspections, prepare reports and make recommendations, draw up cost estimates for specific jobs, and do valuations of particular properties. They recommend progress payments and on completion of jobs inspect and test the completed buildings or installations for compliance with the required specifications.

They are not only in charge of the artisans in their department, but also of the contract workers, because most of the work is done on a contract basis by private contractors. They also come into contact with architects and engineers.

TRAFFIC OFFICER

Traffic officers perform duties within the municipal boundaries. They test prospective drivers for licensing and inspect vehicles for road worthiness. They control traffic and ensure that traffic flows effectively, enforcing laws and regulations pertaining to road traffic, and may give evidence in cases in the traffic court. In some provinces the work of the traffic officer and the provincial inspector are combined. In other, a distinction is made between the traffic officer and the provincial inspector. The traffic officer controls traffic, patrol roads/ highways, while the provincial inspector protects the public from malpractices, particularly in commerce and ensure that trading hours are kept.

Management

BUILDING MANAGER

Building managers use their knowledge of all aspects of building and construction in a practical capacity when they plan and oversee building projects and advise architects, engineers and quantity surveyors on specific aspects of building practices.

They see to aspects such as different subcontractors, materials needed, time available, contracts and regulations, and provide liaison between architects and building contractors. There are five important functions which building managers perform themselves, or of which they should have a sound knowledge: purchasing, calculation of expenses, planning, building surveying and control management.

Although they do not necessarily carry out these tasks themselves, they should see to it that these aspects of the building process run smoothly. They can work in various positions as project managers of large building projects, building controllers for large municipalities or contract or financial managers. They may also act as technical advisers when buildings are planned and constructed.

BUILDING CONTRACTOR

Building contractors are independent construction specialists who bid on specific assignments within a major construction project. The construction of one large building might involve many contractors and subcontractors working together towards its completion.

The contractor must analyse the specifications of the work and determine the materials, personnel and related costs which would be required to complete the assigned task. When all of these factors have been considered, a bid is submitted. If the firm accepts the contract, the contractor must then supervise the purchase of materials and the work of the various skilled artisans and labourers who are assigned to the project.

CHARTERED SECRETARY

Chartered secretaries co-ordinate and direct the support services of a business. It is the chartered secretary's responsibility to ensure that a company is legally constituted, economically viable and properly organised. This is a pivotal and senior position in a company and is very often the route to a directorship.

Chartered secretarial work is very wide-ranging in its activities and any one or more of the following may be included in a day's work: ensuring that the affairs of the company are carried out in accordance with the Companies Act; calling shareholders to the Annual General meeting; drafting agendas for and taking minutes at board meetings; assessing the impact on the company of new taxation legislation; and analysing proposals for changes to the company's computer system. The company secretary will also regularly communicate with people across a wide range of authority levels in the company.

COMPANY SECRETARY

Company secretaries perform routine management duties which enable their employers to attend to other matters. They keep records of all activities in the firm and distribute information to the departments concerned. They see to it that certain returns are filed with the Registrar of Companies as stipulated in the Companies Act.

It is their task to see to the installation and maintenance of an information system which is relevant to the policy and decisions of the company. They are responsible for contracts and agreements undertaken by their firms.

They may handle lists of shareholders, share issues and share transfers and send out dividends that are declared from time to time. They attend directors' meetings and keep minutes.

CONSTRUCTION MANAGER

Construction managers are responsible for co-ordinating building projects from the time they are initiated until they are completed. They apply basic building principles to solving practical problems on site. Their duties include: site setting out and organisation; hiring and supervision of labour; determining which equipment to use and where to place it on the site; supervision of programming operations; and identifying problem areas and taking corrective action.

Construction supervisors effectively form a link between management and the workers on site.

CREDIT MANAGER

Consumers and businesses use credit to buy houses, cars, large domestic appliances, raw materials used in manufacturing and merchandise to be sold in stores. Credit managers (credit authorisers) have the final authority in accepting or rejecting credit applications.

When evaluating a credit application the credit manager analyses detailed financial reports, interviews the representatives of the various companies, and reviews credit agency reports to determine the records of such firms in repaying debts. Some credit managers in banking institutions, for example, determine whether the personal details such as the income and address of a credit card applicant are correct before the credit card is approved. Credit managers therefore need to contact a wide range of information sources to verify an applicants personal, financial and other relevant details. If clients fail to pay after these attempts the credit managers refer these cases to there attorneys.

FINANCIAL AND INVESTMENT MANAGER

Financial managers are responsible for managing and controlling the financial matters of a company. In large corporations they oversee the functions of financial employees appointed to take care of specific aspects of the financial division, but in smaller companies the financial manager is responsible for performing all tasks himself. The duties of a financial manager include: regular evaluation of the company's performance against budgets and targets; drawing up budgets; and submitting the company's tax returns. The financial manager also needs to record, analyse and interpret all financial information relating to the company and to keep senior management regularly updated and is expected to report financial problems immediately so that suitable strategies can be devised to avoid disaster.

Investment managers are responsible for finding the best possible way of investing the company's money and other such assets. These could be shares in the stock market, property, debentures, artwork or some other type of investment. The work involves a great deal of administration which would, in a large corporation, be dealt with by a company secretary. The duties of financial and investment managers are so closely linked that they are normally combined in smaller companies.

FOOD SERVICE MANAGER

The primary function of food service managers is to manage the process of serving food to a large number of people. The food service manager motivates a large team of workers to work quickly and efficiently to produce food that is tasty, attractively served and prepared according to high standards of hygiene. This is a senior position. Although food service managers are not chefs -- they manage the process of food preparation --, they should be prepared to roll up their sleeves and help out where needed if things get hectic.

Food service manager's duties cover a wide range, depending on the sectors of the industry in which they are employed. For example, a hospital would require modification of menus to suit certain diets, a school canteen may require recipes to be standardised and restaurants require menu planning and analysing . Food service managers' responsibilities include setting up supplier relationships and ordering and storing food. Financial control and administration are important in this line of work -- this applies to financial control of the food products and the wages of the kitchen staff.

Another important aspect of the job is the food service manager's ability to deal with people effectively. This applies to handling staff problems and dealing with dissatisfied customers.

GARAGE MANAGER

Garage managers are responsible for the total organisation of garages. An important part of their duties is the supervision and control of personnel. They hire, train, promote and terminate the services of employees when necessary in co-operation with the different sub-managers in charge of the various departments of the garage.

They also supervise promotion activities such as the display of specific motor vehicles for which they are agents, and the display of parts and accessories.

They are directly responsible for retaining the goodwill of the public by ensuring satisfactory service and creating and maintaining a sense of shared purpose among the garage staff. Also, as managers, they should run the garage on a sound basis.

HOTEL / MOTEL MANAGER

Hotel or motel managers are responsible for operating their establishments to ensure maximum profitability for directors while providing the best service for their guests. Company policy determines the room rates and credit policy.

They may manage all departments of the hotel/motel or have heads who manage the individual departments of housekeeping, accounting and food services. Hotel/motel managers are responsible for handling any problems or emergencies which may arise. They consult on proposed changes in menus, investigate existing cost structures and reassess marketing procedures and methods to reach additional prospective customers.

In some hotels which have conference rooms, managers cater for weddings, meetings and conferences. Hotel/motel managers work in large or small hotels, motels or resorts.

HUMAN RESOURCES MANAGER/PERSONNEL MANAGER

Human resources managers work together with top management officials to plan personnel policies that will meet the needs of employers and employees. They forecast employment requirements, and co-ordinate transfers, promotions, dismissals, salary increases and reinstatements.

They keep evaluation and confidential records of employees. They also recruit, select, test, appoint and place staff in suitable posts. They control the progress of all activities and modify policy to meet particular objectives. They give personal attention to new programmes and personnel problems, stay updated on labour laws and advise employers and employees on their obligations and rights. They often represent management in negotiations with trade unions and employees' - associations on issues such as salary increases. They promote employee welfare such as benefits, leave, housing schemes and medical aid.

The job description of personnel managers or human resources managers depends on the type and size of the organisation where they work. Bigger companies usually have a team of people working in the human resources department, where each one has a particular section to manage. These sections may include the following: staffing, training or human resource development, staff utilisation, organisation planning and development, labour relations, remuneration, research, management, staff welfare and administration.

MARKETING MANAGER

Marketing managers promote and sell their company's products and services to other businesses, merchants and institutions.

Marketing managers need to be thoroughly familiar with the products or services they promote as well as with their use. They should also know the special needs of customers. They are responsible for recruiting, selecting, appointing and motivating marketing personnel. They must know and apply marketing techniques such as advertisements and displays, market research, and identification of marketing opportunities.

They are responsible for the formation of marketing divisions and the assignment of authority and responsibility for marketing tasks. Practically every type of manufacturer employs marketing managers and sales managers. Larger organisations employ specialists in various sub-fields of marketing management. The marketing manager works closely with the market researcher.

PRODUCER - FILM AND TV

- see page 10

PRODUCTION MANAGER

Production managers plan, organise, manage, co-ordinate and control production. This entails the transformation of raw materials or a combination of raw materials into the final product.

They select new tools, machines and equipment and the most effective production processes and procedures for use in industrial plants. They arrange machinery and equipment and plan the work flow. They decide whether all components should be manufactured or whether some should be obtained elsewhere. They also conduct time and motion studies, analyse production jobs and set standards of production and performance for workers.

They design processing systems and apply research techniques to production and other problems. They devise ways to keep health and accident hazards to a minimum, study cost and quality of products and develop management control systems. These activities often require the application of statistical techniques in order to find the most favourable solution to production problems.

PURCHASING MANAGER

Purchasing managers ensure the effective supply of machinery, raw materials and services to enterprises by buying items which are used or processed by their employers.

Their main duty is to find suppliers who offer the best value. They therefore compare catalogues and journals, telephone suppliers, examine samples and attend demonstrations and conferences. They consult with employees in the various departments to determine the specifications of the items needed.

They must establish good business relationships with suppliers in order to obtain satisfactory payment plans, quick delivery for emergency orders and cost savings. Purchasing managers must check delivered goods before they can authorise payment. The purchasing manager must have a sound knowledge of every aspect of the company.

SALES MANAGER

Sales managers organise and monitor marketing and distribution strategies. Their work includes the supervision of the sales staff and the development of sales programmes designed to introduce prospective customers to new products and services.

Sales managers are also responsible for reviewing market trends and evaluating sales. Sales management may include the development of a network of dealers who sell a product in the field.

It is important that the sales manager leads by example in providing an excellent service to clients and the public at large. Poor service can lead to a decline in profit for the company. The sales manager must provide the sales staff with the best training and information on sales strategies. In bigger companies there may be more than one manager and every manager may be responsible for a separate department.

STAGE MANAGER

- see page 10

STOCK CONTROLLER / INVENTORY AND STORES MANAGER

The prime responsibility of a stock controller is to control the stock of the organisation by which he is employed. Controlling stock comprises a number of tasks, including: ensuring that stock is properly stored to prevent damage; ensuring that proper security measures are in place so that unauthorised persons do not have access to stock; preparation of requisitions and other paperwork for ordering new stock; controlling a back-order file and releasing stock accurately and timeously on receipt; checking documentation, amounts and condition of new stock; returning damaged stock to suppliers; establishing when unused stock needs to be disposed of; payment of suppliers; and control of the stock control department's budget.

STOCKBROKER

There are many career directions that can be pursued in the fast-moving world of stockbroking. Portfolio managers in the Investment Department assess their clients' financial status. Analysts in the Research Department analyse the companies listed on the stock exchange. The information that they compile assists portfolio managers in investing their clients' funds and is sold to the broker's clients by the Institutions and Client Services Departments.

The dealer who works on the trading floor presents the popular image of the stockbrokers. There are various categories of dealers: unauthorised clerks 'run' orders from the trading desk to the dealers; the authorised clerk carries out buy and sell orders with dealers from other brokers; institutional dealers take and carry out buy and sell orders over the telephone from South African corporations and offer companies market information; arbitrageurs do the same as institutional dealers, but they deal with overseas institutions. The Derivatives Department trades in the futures and options market, an area so unpredictable that it is often said that these dealers are born with a 'nose' for the job. The dealers do the trading in this market and strategists apply their knowledge and experience to the market to develop new strategies.

The Corporate Finance Department lists shares on the Johannesburg Stock Exchange and the Administration Department does the paperwork for all the other departments -- a task which can become quite pressurised at times.

Medical Science & Technology

ACUPUNCTURIST

Acupuncturists treat patients with ailments by inserting needles of various lengths into their bodies at various points. Acupuncturists will first consult with their patients to establish their histories and the problems that have been diagnosed by traditional doctors and then apply their knowledge of acupuncture to determine the points at which the needles should be inserted. Each point is believed to be effective in the treatment of a different ailment. The needles are left in the body for a specified time.

according to the ailment being treated, and then removed.

Acupuncture is an ancient Chinese art and is a branch of holistic medicine. It is used in the treatment of ailments such as arthritis, hypertension and ulcers, when patients seek an alternative to traditional medicine. People seeking to cure themselves of addictions such as smoking and drug-taking and those seeking a way to lose weight often consult acupuncturists.

ANAESTHETIST

An anaesthetist is a medical doctor specialising in the administration of local and general anaesthetics to patients about to undergo a medical procedure. The anaesthetist first consults with patients to ascertain their history in respect of allergies, previous reactions to anaesthetics and current medication and then monitors patients throughout the medical procedure and their recovery from the anaesthetic. The anaesthetist also follows up on patients' immediate post-operative recovery to establish whether the anaesthetic is causing any adverse side-effects.

BEAUTY TECHNOLOGIST   SOMATOLOGIST

see page 11

BIOKINETICIST

Biokineticists are human-movement specialists who prescribe exercise routines either as a preventative health measure or to correct a health problem such as a sports injury or recovery from disease or illness. Biokineticists work closely with their clients' doctors and other medical practitioners. A very important aspect of the work is the accurate evaluation of the client's physical condition. The biokineticist uses scientific methods and instruments to assist in the evaluation and prescribes a programme of healthy exercise based on the results thereof.

BIOMEDICAL ENGINEER

Biomedical engineers use engineering principles to solve medical and health-related problems - an example would be the production of a mobility aid such as an artificial leg for someone who has lost a leg in a car accident. Biomedical engineers design and develop medical instruments and devices such as artificial organs, hips and heart valves, pacemakers and monitoring devices, and adapt computers to serve medicine.

Research ranges from the study of engineering aspects of human biological systems to the improvement of existing medical devices. Biomedical engineers may arrange testing to ensure the continuing safety of electronic, electrical and mechanical equipment used for the diagnosis, treatment and monitoring of patients. Some biomedical engineers advise and recommend the purchase of new equipment to administrators. Duties may also include the training and supervision of technicians.

CHIROPRACTOR

Chiropractors diagnose and treat patients whose health problems are associated with the body's muscular, nervous and skeletal systems, especially the spine. They believe that if anything is interfering with any of these systems it will impair the normal functions of the body and lower its resistance to disease.

Chiropractors follow a standard routine of diagnosis, which is much the same as that used by traditional doctors. They consult with patients regarding their history and carry out physical, neurological and orthopaedic examinations, arrange pathological tests and arrange and interpret X-rays, which they regard as an important diagnostic tool.

Chiropractors' approach to healing is holistic, so they do not prescribe drugs or perform surgery. They will, however, refer a patient to another medical practitioner if they feel that this is necessary. Their treatment entails manipulation or adjustment of the spinal column, the use of traction, massage, acupuncture, heat therapy, and the application of support braces and advising the patient with regard to lifestyle changes in respect of diet, exercise and rest.

DENTAL TECHNICIAN

Dental technicians are skilled crafts people who make and repair dental restorations such as bridges or dentures (both metal and plastic), crowns, and maxillo-facial prostheses.

Dental technicians follow the directions or prescriptions of a dentist and do not deal with patients themselves. They may be generalists and perform all types of laboratory work or they may specialise in such areas as denture construction or bridgework.

When a denture has to be made, the dentist obtains impressions of the patient's gums and palate, from which the technician makes a model. When this has been modified for comfort, the final dentures are cast in an acrylic material or artificial resin. Dental technicians make crowns, bridges and fillings, and work with braces or correction appliances. The product that the dental technician is making usually affects the appearance of the patient, which means that the work of dental technicians needs to be very precise and neat.

DENTAL THERAPIST

Dental therapists take care of most of the dental needs of people who are reliant on the state health services for their health-care needs. The work of dental therapists can be classified as preventive dentistry and they need to recognise when patients should be referred to dentists for more advanced treatment.

The dental services that dental therapists offer are dental examinations; simple fillings and extractions; treatment of and the taking of preventive measures against the more common oral diseases; X-rays; cleaning, scaling and polishing; and teaching people how to care for their teeth.

Dental therapists have to register with the SA Medical and Dental Council in order to practise and must work under the supervision of a dentist or a senior dental therapist for at least one year before they may practise on their own.

DENTIST

The job of the dentist is twofold, to treat ailments or abnormalities of the oral cavities and to try to prevent their occurrence or reoccurrence.

Dentists examine teeth and the tissues of the mouth to diagnose diseases or abnormalities. They fill cavities, extract teeth in serious cases and substitute dentures designed especially for the patient. They also treat abscesses and infections of the gums, clean teeth and take X-rays of the oral structures. Dentists may correct malocclusions by straightening teeth.

They also perform corrective surgery of the gums and supportive bones. They provide their clients with information on diet, brushing, flossing, the use of fluorides, and other aspects of dental care.

A dentist in private practice performs a variety of administrative duties such as bookkeeping and the buying of supplies and may also supervise/manage a whole team of co-workers such as dental assistants, receptionists, dental technicians and dental hygienists.

DERMATOLOGIST

A dermatologist is a doctor who specialises in the diagnosis and treatment of skin diseases, such as acne, eczema and psoriasis.

Please refer to the description of a medical doctor for more information.

DIETICIAN / NUTRITIONIST

The dietician interprets the science of nutrition in terms of food for both healthy and ill people. He strives to maintain good health and combat disease in people from all walks of life and from varying socio-economic circumstances. Dieticians, for example, prescribe diets with less salt for people with high blood pressure and a reduction in sugar and fat intake for those who are overweight.

The nature of the dieticians work are closely related to his field of expertise. Dieticians work in a variety of fields and include the following areas of employment:
(1) Hospital work - an administrative dietician (plans meals, trains supervisors, performs administrative tasks). (2) A therapeutic dietician (plans special diets according to the doctor's prescription). (3) A clinical dietician (plans diets for out-patients). (4) An educational dietician (instructs nurses, medical and dental students. (5) Counselling or nutritional education. (6) Quantity catering - industries, government departments, orphanages, old age homes, etc. where quantity cookery is undertaken make use of the knowledge of dieticians.
(7) Research - they work for the Medical Research Institute where intensive research work is undertaken. They also work at the SABS, CSIR, universities, food control boards and so forth. (8) Teaching - they may be appointed as teachers, giving instructions in Home Economics. (9) The media - to write women's columns in newspapers and magazines, to demonstrate for the radio and television. (10) Consulting dieticians - work in private practice and are available to doctors, hospitals and the public.

ELECTROENCEPHALOGRAPH (EEG) TECHNICIAN

An electroencephalograph (EEG) machine measures the electrical activity of the brain. The records obtained are then used by specialists to diagnose diseases and disorders such as epilepsy.

Electroencephalograph technicians operate EEG equipment. After the patient has been reassured and helped to relax, electrodes are selected and placed on the patient's scalp in standard locations. The EEG technician also selects and operates the instrument controls.

While the record is being made the technician observes and records the patient's behaviour. The EEG technician is responsible for the classification and filing of reports and also perform general office duties such as arranging appointments, and ordering supplies and equipment.

GYNAECOLOGIST

A gynaecologist is a medical practitioner specialising in the treatment of diseases and disorders of the female reproductive system. Gynaecologists in this country also practice as obstetricians as the two branches of medicine are so closely related. Obstetrics is the branch of medicine concerned with

29

childbirth and midwifery. Patients are sometimes referred to gynaecologists by general practitioners or they may go straight to a gynaecologist.

HERBALIST

Herbalists use remedies made from plants to stimulate a patient's own bodily defences to produce relief or a cure for ailments and diseases. They require patients to explain their symptoms and to give a detailed medical and dietary history dating back to their childhood. Some herbalists use modern diagnostic methods such as blood-pressure tests, biochemical tests or sending the patient for X-rays. Once a diagnosis has been made the herbalist gives the patient a remedy made from plants, either bought or gathered by himself or herself, which is specifically blended to deal with the patient's particular condition.

The herbalist's approach to medicine is essentially holistic so he or she also advises patients in respect of diet, exercise, breathing and other lifestyle factors which could impact on their health. Some herbalists sell ready-made remedies to pharmacies and health shops.

HOMOEOPATH

Homoeopaths are legally recognised medical practitioners who treat patients who are ill in a different way from conventional medical doctors. They diagnose illnesses as traditional doctors, but follow homoeopathic principles in the treatment of the ailments.

Treatment entails the administering of tiny quantities of specially prepared plant, mineral and other therapeutic substances. Popular interest in holistic medicine has encouraged a growing number of people to consult homoeopaths.

MEDICAL LABORATORY TECHNOLOGIST
BIOMEDICAL TECHNOLOGIST

Medical technologists assist doctors and pathologists in the diagnosis of disease by performing all kinds of clinical laboratory tests. They play an important role in the fight against diseases.

The four main lines of work are diagnostic work, researchwork, blood transfusion technology, and the preparation of serum and vaccines. The medical laboratory technologist does not work directly with patients. He forms part of a laboratory team, assisting a 'professional officer' who has a degree. Some technologists identify disease-causing organisms, parasites, fungi, viruses and cancer cells, and some do research, and develop new laboratory techniques, while others teach at tertiary institutions.

The medical laboratory technologist in the blood transfusion technology field conducts tests on blood to determine blood groups and diseases like aids and hepatitis. These technologists must be extremely careful because most of the time they work with infected material. Medical laboratory technologists train and supervise laboratory assistants and other technologists.

MEDICAL PHYSICIST

Medical physicists specialise in applying physics to medicine. They provide a professional service in medical physics, consult with physicians, conduct multi-disciplinary research and teach physics to medical students and other medical staff. Medical physics can be sub-divided into three different applications: radiotherapy, nuclear medicine and diagnostic radiology.

Radiotherapy is the treatment of patients with malignant conditions such as cancer by the application of ionising radiations. The medical physicist is responsible for ensuring that the correct dose is delivered accurately.

Nuclear medicine makes use of radionuclides to diagnose diseases. Patients are given prescribed quantities of radionuclides and images of their organs are obtained by means of a computerised scintillation camera. The information obtained from these images assists in diagnosing the patient's disease. Medical physicists also work closely with nuclear medicine physicians to develop new and improved techniques of assessing organs.

Medical physicists working in diagnostic radiology must ensure that the X-ray equipment complies with safety standards, that optimal exposure techniques are used and that patients and staff are not exposed to more radiation than is absolutely necessary.

MEDICAL PRACTITIONER (DOCTOR)

Medical practitioners (doctors) are licensed practitioners of the science of medicine, who diagnose diseases, prescribe medications and otherwise treat diseases and disorders of the human body.

They can work as general practitioners who care for all general complaints that do not require in-depth treatment, as medical officers in hospitals or as specialists in a specific field. Doctors question the patient, take medical histories, and perform physical examinations seeking the true cause of the complaint. They may then prescribe medication or may refer the patient for further investigation or treatment to one or more of the specialists. General practitioners may perform small operations or assist surgeons with big operations.

The medical practitioner in private practice performs a variety of administrative duties like bookkeeping and the buying of supplies. He may also act as supervisor/manager of a wide range of people working close with him. His team may include nurses and receptionists.

NEUROLOGIST

A neurologist is a doctor who specialises in the diagnosis and treatment of diseases of the nervous system, for example Parkinson's disease, multiple sclerosis and brain tumours.

You may refer to the description of the medical doctor for more information.

OCCUPATIONAL THERAPIST

The occupational therapist assists the physically disabled, the mentally disturbed and children with developmental or learning disabilities to function independently in everyday life.

Occupational therapy includes programmes for the improvement of physical functions (e.g. power and dexterity of the hands-), improvement of mental health (e.g. social adaptability), the improvement of self-care, self-management and personal independence (the occupational therapist also advises on adaptations, aids devices and structural alterations to buildings to enable the patient to function independently), and the promotion of the normal development of the sick or disabled child.

The occupational therapist uses everyday activities as treatment medium. The activities includes personal management activities, work activities, recreational activities and children's play activities. The tools and equipment used are in accordance with each activity.

One can conclude that the occupational therapist helps patients to regain their self-confidence, to be able to act independently in spite of their physical, psychological and social limitations.

OPTOMETRIST

Optometrists examine eyes for vision problems, disease and other abnormal conditions. They test for proper depth and colour perception and the ability to focus and co-ordinate the eyes. When required, they prescribe lenses and/or treatment. When disease is found, they refer patients to an ophthalmologist for treatment.

Many optometrists supply the prescribed eyeglasses and fit and adjust contact lenses. They also prescribe corrective eye exercises or other treatment not requiring drugs or surgery. In addition, optometrists consult with educators for preventive vision care for school children, and with public officials and management to help eliminate vision hazards. The optometrist informs people about the correct reading habits, lighting and general eye safety.

ORTHOTIST-PROSTHETIST

Orthotists-prosthetists design and make artificial limbs (prostheses) and surgical appliances such as callipers, splints, braces and surgical shoes (orthoses).

Patients are measured to ensure that the new appliance or limb will fit perfectly. A cast is made of the applicable part of the patient's anatomy and the appliance or limb is constructed, using the cast as a point of measurement throughout the process. The orthotist-prosthetist then constructs the appliance or limb from a variety of materials, using a number of processes, including sawing, drilling, riveting, moulding molten plastic, and mixing pigments to match skin colour and applying them to the artificial limb.

The orthotist-prosthetist then tests the limb for freedom of movement and other functional efficiency. He or she measures and modifies the finished product on the patient until the patient is satisfied. The orthotist-prosthetist will also spend some time with the patient, instructing him or her on the proper use of the new appliance or limb.

PAEDIATRICIAN

Paediatricians care for the physical, mental and emotional health of children from birth to adolescence.

They examine children at regular intervals to prevent problems, as well as examine, diagnose and treat illnesses or injuries. They advise parents on health, nutrition, development and other aspects of child care. When children are chronically ill or handicapped, paediatricians advise parents and children on special services.

At times they consult with or refer patients to other specialists. Paediatricians may also serve as counsellors in situations ranging from advising parents on infant care to helping adolescents with emotional problems.

PATHOLOGIST

Pathologists study the nature, cause, development and effects of disease. Pathologists provide and interpret laboratory information essential to medical diagnosis and patient care.

Some pathologists perform autopsies to determine the nature and extent of diseases, the cause of death and the effects of treatment. Others supervise and co-ordinate the performance and reporting of a wide range of diagnostic and screening tests and maintain a rigid system of quality control to ensure the accuracy of test results.

Many pathologists are involved in research concerning the nature and origins of disease and the possibilities for prevention and cure. Other pathologists teach medical students, nurses and other health science students.

PHARMACIST

The pharmacist forms the link between the pharmaceutical manufacturer and the medical doctor, the doctor and the patient, and the patient and the community. His role in the health team is to manufacture, prepare and supply suitable and safe medicinal products for the prevention or cure of illness in man.

The nature of a pharmacist's work varies to a great extent, depending on the pharmaceutical field in which he is employed. The following possibilities exist retail pharmacy, industrial and wholesale pharmacy, hospital pharmacist, education and research, civil service pharmacists -- (as administrators and inspectors in government departments). Some pharmacist conduct research while others are involved in training.

PHYSICIAN

Physicians are medical doctors who have specialised as diagnosticians in internal medicine. They study the basic bodily systems (digestive, circulatory, respiratory, etc.) so that they can identify the causes of unusual internal disorders.

Many patients are referred to them by other doctors who have been unable to locate the source of the patient's complaint. Physicians perform tasks similar to those of a general practitioner and often recommend laboratory tests and X-rays to aid diagnosis. Once the problem is defined, the physician treats it by accepted medical methods. Internists may specialise in the treatment of allergies, the cardiovascular system, gastro-enterology, pulmonary diseases, nephrology or rheumatology.

PHYSIOLOGIST

Physiologists are biological scientists who study the various life functions of plants, animals and man under normal and abnormal conditions. They specialise in the study of cells, tissues or one of the organs. They are interested in the internal 'communication' of organs, energy procurement and utilisation, blood circulation, defence systems against infection, repair mechanisms, reproduction and metabolism.

Some physiologists investigate the effects that factors such as drugs or pollution have on the life processes and bodily functions of plants and animals. Physiologists have provided the basis for much of the work done by pathologists, nutritionists and toxicologists.

PHYSIOTHERAPIST

The physiotherapist is a member of the medical team and as such evaluates, plans and carries out treatment programmes for the ill and for handicapped persons. One can argue that the physiotherapist not only treats people with sport injuries, but people from a wide spectrum. The physiotherapist helps the client to function effectively within the limitations of his injury or disability.

A wide range of skills is used, including mobilisation, massage and manipulation, together with electrical equipment. These skills are used to relieve pain and stiffness in joints, to improve muscle strength and co-ordination, and to help disabled people to lead useful lives with as much independence and personal fulfilment as possible. Physiotherapists treat all age groups, from babies, children and adolescents through to senior citizens.

The emphasis is not only on the treatment of patients. Preventive and educational programmes are also essential aspects of this worker's role. The nature of the work includes the application of thermotherapy, electrotherapy, ultra-sound, infrared radiation, massaging and exercise.

PODIATRIST / CHIROPODIST

The function of the podiatrist is to maintain the human foot in its healthy state and to treat abnormalities. Podiatrists diagnose and treat deformities and diseases of the foot. They prescribe preventive measures and perform minor operations using a local anaesthetic. At present the extent to which podiatrists may prescribe medication and drugs is limited by law. If the symptoms they observe in the foot suggest other problems, they refer patients to medical specialists. Podiatrists usually handle all kinds of foot care problems but some specialise in specific disorders.

PSYCHIATRIST

Psychiatrists are physicians trained to deal with the prevention, diagnosis and treatment of mental disorders. Psychiatrists take complete histories of their patients, including medical, emotional, and developmental information.

After obtaining a complete history, the psychiatrists determine the nature and degree of the disorder and decides on the treatment programme. The psychiatrist then directs or administers the kind of care and treatment necessary.

Psychiatrists may be involved in research or teach at universities. In addition, they may serve as consultants in courts of law, special schools and community agencies.

RADIOGRAPHER

Radiographers apply X-rays and radioactive substances to patients for diagnostic and therapeutic purposes. All radiographers work at the request of a qualified doctor or dentist. (This is not to be confused with radiologists or radiotherapists, who are medical specialists.)

There are four categories of radiography (1) Diagnostic radiographers capture X-ray images of the human body on film or other media using sophisticated X-ray equipment.

(2) Therapeutic radiographers localise, plan and administer radiation treatment mainly in the treatment of cancer. (3) Nuclear medicine radiographers prepare and utilise radioactive pharmaceuticals to capture diagnostic images of the anatomy and physiology of the patient. (4) Ultrasound radiographers produce images of the human body using equipment which generates high-frequency sound waves. Radiographers may be involved in administration, personnel management or teaching.

REFLEXOLOGIST

Reflexology is a branch of holistic medicine which is based on the principle that every part of the body corresponds to reflexes in the feet and that working on the feet in a specific way can help to heal those parts of the body. Exponents of reflexology believe that disease today is caused by the body being constantly exposed to stress, which gradually erodes its immune system. A reflexologist therefore aims at reducing stress, thus enabling the body to heal itself naturally. Circulation and the supply of nutrients and oxygen to the cells improves when the body is in a state of relaxation. Reflexologists, in keeping with their holistic approach to healing, combine this special treatment with advice on nutrition, exercise and positive thinking. Reflexology is not regarded as a replacement for medical treatment, but as an additional maintenance therapy.

SPEECH THERAPIST AND AUDIOLOGIST

These therapists diagnose and treat patients who have voice, speech and language disorders. They can, for example, help children who stutter to overcome or reduce there problem.

They test various aspects of hearing, fit hearing aids and provide therapy for patients with impaired hearing. (Unless otherwise stated, the term 'speech therapist' as used here covers the audiologist as well.) Depending on the cause of the disorder they may work individually or as a team with one or more of the following: medical doctors or specialists, psychologists, physiotherapists, social workers, educationists and occupational therapists. Once the problem has been identified, speech therapists work out individual programmes for patients. They provide therapy and work with patients either individually or in groups. In many cases the family of the patient is involved in the therapy. The therapists are also responsible for programmes that focus on the prevention and identification of communication disorders.

SURGEON

Surgeons are doctors who specialise in performing surgery to prevent the spread of disease, to correct deformities, to repair injuries and to improve body functions.

Most surgeons are in private practice. Their patients are referred to them by general practitioners and specialists. The surgeon examines each patient as completely as possible, reviews his medical history and consults with other doctors to be sure an operation is necessary. The procedure is explained to the patient and/or the family.

Before surgery, surgeons check the equipment, instruments and surgical setup to be sure everything that is needed is present and sterile. After surgery the patient's condition is monitored until recovery from the effects of the operation is complete.

VETERINARIAN

Veterinarians diagnose and treat animal diseases and disorders. They test dairy herds for tuberculosis and brucellosis, and inoculate animals against diseases such as rabies and hog cholera. They perform autopsies to determine causes of death, inspect animals intended for human consumption, both before and after slaughtering. They advise on the care and breeding of animals. They engage in general practice, treating various animal species, or specialise, restricting their practice to pets or single species. They may engage in a particular function such as research and development, consultation, teaching, technical writing, the sale or production of commercial products, or the rendering of technical services for commercial firms.

VETERINARY TECHNOLOGIST

In the laboratory, veterinary surgeons and scientists are assisted by veterinary technologists and veterinary nurses.

The veterinary technologist is specially trained to execute laboratory procedures, to handle and inject animals and to record observations. He is also expected to implement animal health schemes and to control disease in the field.

Their tasks can be divided into three main categories. (1) Diagnosis They collect specimens of plants, feeds, blood and tissues from animals for testing to determine the causes of disease or deaths. (2) Research This is carried out in disciplines such as virology, bacteriology, parasitology, toxology, pathology and nutrition. The research mainly focuses mainly on preventing animal diseases and on methods of increasing animal productivity. (3) Manufacture Veterinary treatments (antigens and vaccines) are produced.

Natural Science & Mathematics

ACTUARY

Actuaries are experts in the theory and practice of statistics, and specifically those of mortality, sickness, retirement and unemployment. Actuaries work mostly with numbers and figures.

They devise, compile and develop life insurance policies, pension and medical aid schemes and perform other specialised functions mainly relating to the assurance industry. They also deal with investments of life assurance companies, for example the investment of money in government stock, mortgage bonds, ordinary and preference shares, property and other securities.

A considerable amount of the actuary's time is devoted to the evaluation of a company's liabilities in respect of all policies.

AGRICULTURIST

The agriculturist is a scientist specialising in one or more aspects of biology or agronomy for the purpose of providing food or increasing its production .

Agriculture includes crop science and animal science. The agriculturist is therefore someone who specialises in an aspect of crop science or animal science. Crop scientists (agronomists) investigate field crop problems and develop new and improved growing methods to obtain higher yields or better quality. They may specialise in a specific crop, group of crops, production, weed and pest control, or irrigation.

Animal scientists conduct research on animals, and develop scientific methods of breeding, caring for and managing domesticated animals. They may specialise in certain types of animals, their breeding, physiology or nutrition, meat, butter or eggs.

AGRONOMIST

Agronomists (or grassland scientists) investigate field-crop problems and develop new and improved growing methods for higher yields or better quality. They provide information on plant diseases, weed killers and the biological control of insect pests. They advise farmers about crop rotation, fertilisers, field drainage and irrigation. Agronomists may become manufacturers' representatives and show farmers the most effective uses for new products. They may travel to neighbouring countries to help the people increase their food production by means of new techniques. They may work on developing new types of grain, legumes and grasses with techniques that will increase and improve food production and help replenish soil.

ANALYTICAL CHEMIST

Analytical chemists examine the composition, structure and characteristics of a variety of materials and the processes and changes they undergo. In particular, they investigate which substances are present and in what quantities. They also aim to develop new methods of analysis. Analytical chemists work closely with a team of chemists who are all specialists in their own fields. They conduct their experiments in a laboratory and usually write their reports in their own offices.

ANIMAL SCIENTIST

Animal scientists are concerned with the study, rearing and management of livestock. They may work on the economic provision of meat, milk, eggs, textile fibres, leather and a variety of products essential to man. They advise on production and the presentation of animal products. They conduct research in the areas of animal selection, breeding, feeding, housing and disease control. Some may control breeding practices to improve certain strains in animals.

AQUATIC SCIENTIST

An aquatic scientist (limnologist) is a person who studies the physical, chemical, biological and ecological aspects of inland and marine water environments. He studies physical aspects such as temperature, the available light and water movements; chemical aspects such as the organic and inorganic composition of the water; biological aspects, which entails detailed observation of the various types of aquatic plants and organisms; interrelated aspects such as the relationship between organisms and their environments; and other aspects such as the control of forms of pollution that causes fish to die. An aquatic scientist's time is divided between being in the laboratory and being out in a water environment when he is busy with research.

ARCHAEOLOGIST

Archaeologists reconstruct records of extinct cultures. They study, classify and interpret artefacts, tools, art and dwellings to obtain a better insight into the history, culture, social, spiritual and technological activities of earlier societies.

An archaeologist's job can be divided into broad categories. The task begins with field work, which entails the excavation of an archaeological site. Plans have to be drawn of the site, meticulous records kept, photographs taken and the objects found sorted and numbered. The next step is the work in the laboratory where the objects are scientifically analysed. Finally the archaeologist has to interpret his or her findings and write them up in a report, which may be published in a scientific journal.

ASTRONOMER

Most astronomers are involved in research, teaching or a combination of both. Astronomers are experts in the fields of mathematics and physics. They use their knowledge, for example, to study the uni[illegible] this knowledge can be applied to developing navigational systems that will enable us to find our way through space.

Theoretical astronomers concentrate on developing theories concerning various aspects of -or objects in- the universe, based on their knowledge of physics and the observations made by other astronomers. Observational astronomers plan research which involves the measurement of electromagnetic radiation (such as light waves). They analyse the results they obtain and publish their findings so that others in the field will have access to the information. It is possible to work in both theoretical and observational astronomy, though most astronomers tend to be more active in one or the other. Some astronomers also teach Mathematics or Physics at university.

BAKERY TECHNOLOGIST

see page 13

BIOCHEMIST

The biochemist is a scientist who deals with phenomena that distinguish the living from the ginanimate (non-living) in chemical and physical terms, whether animals, plants or micro-organisms. He endeavours to breach the gap between the highly integrated activity of the living cell (a biological unit) and the properties of its individual components.

Biochemists are employed in different fields that determine the nature of the work. Biochemists, for example, conduct research into ways of re-using waste materials. Their work can therefore play an important role in preserving the earth's natural resources.

BOTANIST

Botany is the branch of biology that deals with plant life. The botanist's work is very important because human beings depend on plants for food.

Botanists conduct research into all aspects of plant life. They may identify and classify plants, study the structure of plants, and study the relationship between the environmental influences of rainfall, temperature and sunlight. Plant physiologists study the effect of nutritional components on plant growth. These physiologists usually concentrate on one crop group or one plant process. Plant pathologists are specialists in the causes and control of plant diseases. Weed scientists study the different types of weeds and also how to control them without destroying the environment.

CARTOGRAPHER

Cartographers draw up and revise maps that provide the map user with information about the earth's surface. The cartographer gets his information from aerial photographs, field reports, historical manuscripts and other charts and statistical reports.

He produces the chart using photolithography, drawing and etching techniques. The cartographer works with computer programs and printouts and photogrammetry which gives a three-dimensional perspective of the landscape.

Cartography is concerned with four different map processes: linework (sketching lines and engraving) colour separation (the preparation of different masks for each separate colour for multi-colour maps), the positioning of letters and symbols, and the reproduction of maps.

CHEMICAL ENGINEER

Chemical engineers are involved in all phases of chemical processes and chemical production. Some engineers work in research, designing and performing experiments and then analysing the results. Others help to design and construct manufacturing facilities, occasionally designing a pilot (or test) plant as a first step and following through to the final step of supervising the workers constructing the final installation.

Some engineers help to solve the problems involved in producing high quality products at the lowest possible cost. Chemical engineers also work closely with financial and marketing specialists to ensure that all projects are economically viable.

The safety of the environment and its protection are key areas of their concern because chemical engineers work with life threatening chemicals and gases. Management and teaching are other fields of work for chemical engineers. As a manager it is the engineer's responsibility to see that the chemical plant operates at a profit and not at a loss.

CHEMICAL LABORATORY TECHNICIAN

Chemical laboratory technicians work with chemists and chemical engineers to develop, produce, sell and utilise chemicals and related products and equipment. They set up and conduct tests on products or processes being developed or improved. They must measure reactions, analyse results and carefully record data from these tests and experiments.

Some technicians assist with design, equipment installation, and the training or supervision of operators on the production line. Others test materials, production processes and final products to make sure they meet specifications and quality standards. A few technicians work as sales personnel.

CHEMIST

A chemist's work revolves around examining the composition, structure and properties of different materials, as well as the processes and changes they undergo. They work in research and development as well as production and inspection.

In the research and development field, the properties and composition of matter and the laws that govern the combination of elements are investigated. Chemists use their knowledge and research findings to help create or improve products. Chemists have been instrumental in fields such as the development of new paint and drug products.

In the fields of production and inspection, instructions are prepared for plant workers, specifying the kind and amount of ingredients to use and the mixing time for each stage in the process. In the inspection area, chemists test samples to be sure industry and government standards are met.

Chemists may specialise in one of the following disciplines: organic, inorganic, physical, analytical, and theoretical chemistry, as well as biochemistry and industrial chemistry.

ECOLOGIST

Ecologists are scientists specialising in the study of relationships between organisms and those between organisms and their environment, as well as the impact on the environment of population size, housing and recreational facilities, pollution, farming, rainfall, temperature and altitude.

Ecologists spend a lot of their time outdoors observing and gathering information, including specimens from nature. Commercial utilisation of the ecologist's skills has increased along with media and public interest in conserving our limited resources. Large building projects, particularly in areas regarded as being ecologically sensitive, cannot go ahead in these times without a full report from a professional ecologist - and often more than one ecologist is enlisted by different interest groups attempting to gain public approval for their agendas.

ECONOMIC GEOLOGIST

Economic geologists study the deposits of ores and other mineral resources that are mined for commercial purposes. They conduct in-depth research into the processes that have led up to the formation of the deposits. This information is extremely useful to mining companies as it helps them to understand the nature of the resource they are mining and also to locate it in a methodical fashion.

Economic geologists essentially apply geological principles to solving practical problems in the mining industry. The training that they receive enables them to run the geology department on a mine, and to organise a programme of prospecting in the field.

ENTOMOLOGIST

Entomologists are scientists specialising in the study of insects. One aspect of an entomologist's work is conducting the detailed study of insects and their behaviour. Another aspect is the application of this knowledge for the benefit of certain industries and human beings in general. Entomologists develop methods to control and manage insects that damage crops or are destructive or harmful in any other way. They focus on methods that are environmentally-friendly and often use other insects as part of their control strategy. They also identify insects that are beneficial to humans.

EXTRACTION METALLURGIST

The primary function of an extraction metallurgist is to extract valuable metals from the ores in which they are deposited. Metallurgy combines the sciences of chemistry, physics and mathematics with basic engineering principles, so as to concentrate, extract, refine and manufacture metals. Often only a tiny amount of the precious metal is deposited in the ore. The extraction metallurgist is expected to remove all of the metal in an efficient and economical way. He will select an extraction process according to the structures and properties of the metals. The two main classes of extraction process are pyro-metallurgy which makes use of heating and smelting and hydro metallurgy, whereby metals are extracted in solution. Extraction metallurgists constantly investigate methods of improving metallurgical extraction processes.

FOOD SCIENTIST AND TECHNOLOGIST

The food scientist and food technologist are two distinct careers but the day-to-day work is similar. Food scientists and technologists are responsible for applying the findings of research in food processing to the development and improvement of products and processes to be more beneficial to industry and consumers.

Food scientists and technologists conduct research to solve problems in the food industry and to keep pace with new developments. They analyse samples to determine their physical, microbiological, chemical or spectro-graphical nature. They undertake inspection at places of manufacture to ensure that hygienic and grading regulations and specifications are met. They analyse samples at various stages of processing to check quality. They determine whether raw foodstuffs are suitable for processing, and seek methods to make products usable. The food scientist and technologist also performs a fair amount of administrative work and supervision.

FORENSIC ANALYST

Forensic analysts apply their knowledge of chemistry and biochemistry to the task of finding evidence through chemical analysis. Their services are invaluable in police and legal work, since they are called upon to detect traces -or confirm the presence- of substances like poisons, drugs and alcohol in the human body at post-mortems.

This information is then used by the police to assist them in solving crimes, and by the legal profession to secure convictions or prove someone's innocence. Forensic analysts are often cross-examined in court in respect of their findings.

Another branch of forensic analysis is in the field of preventive medicine where foods, beverages and habit-forming drugs are tested to determine their safety for human consumption.

FUEL TECHNOLOGIST

The term 'fuel technologist' is a general grouping for a number of technically-oriented jobs concerned with the process of obtaining crude oil and manufacturing various products from it. Fuel technologists can be employed in any one of the following areas of the petroleum industry: exploration, refining, research and development, quality control, and technical marketing.

Geological fuel technologists are involved in the search for new oil wells. Fuel technologists in the extraction process research the different types of mud used to lubricate oil drill bits. Laboratory fuel technologists working in the refining process test and evaluate crude oil to determine its properties and classification. Laboratory fuel technologists in all areas of the petroleum industry perform various physical and chemical tests for quality-control purposes. Fuel technologists can also move into marketing positions, which require a high degree of technical knowledge in addition to marketing skills.

GENETICIST

Geneticists study the passing on of genetic traits from one generation to the next in plants, animals and humans. The study of genetics can be sub-divided into different fields and each looks at a different aspect of heredity: the qualities and behaviour of chromosomes are studied in cytogenetics; the molecular functioning of genetic material is studied in molecular genetics and this information is used to change genes for commercial - especially agricultural and medical - purposes. In the field of population genetics and plant and animal breeding scientists use their knowledge of genetics to predict the outcomes of cross-breeding different animals and plant types. Doctors use their knowledge of human genetics to aid them in diagnosing and treating hereditary diseases.

GEOGRAPHER

Geographers attempt to relate the earth's physical characteristics to the distribution and habits of people. Geographical study focuses on questions, problems and issues arising from the inter-relationship between people and their environments.

Many geographers teach at secondary schools, colleges and universities. Others are involved in research, studying and analysing natural and human resources, the distribution and structure of political organisations, transportation systems, urban systems, agriculture, industry, regional development, maps, aerial photographs and data from satellites. Maps, graphs and diagrams may be constructed. Expertise in the fields of decision-making, environmental resources provide research backgrounds for other jobs.

GEOHYDROLOGIST

Geohydrologists apply their knowledge of geophysical techniques to locating sources of underground water and establishing its quality. They also locate the positions of waste-disposal dumps and evaluate ground water pollution. Underground water is an important resource in South Africa and geohydrologists offer expert advice to its users. The job involves both office work and fieldwork.

GEOLOGIST

Geologists study the structure, composition and history of the earth's crust. They locate and obtain specimens they wish to investigate by drilling, collecting, or examining samples. The physical and chemical properties of these specimens are then examined in laboratories. When this is completed, geologists write reports on the results of their investigations.

Geological research may help in locating mineral deposits, predicting earthquakes, and advising on the suitability of sites for buildings, dams and highways. Geologists usually specialise in one or more of the following general areas: earth materials, earth processes, or earth history.

Geology is a very broad-based science which draws from virtually every other science including natural, engineering and economic sciences. We can distinguish between the following careers within geology: general geologist, engineering geologist, geohydrologist, palaeontologist and geophysicist. The knowledge obtained from geological research is used in a wide variety of ways, from the plaster on walls of buildings, where lime and other mixtures are used, to the discovery and refinement of oil and other energy sources.

GEOPHYSICIST

Geophysicists study the earth's physical features including its atmosphere and hydrosphere. They examine and measure seismic, gravitational, electrical, thermal and magnetic forces, using the principles of physics, mathematics and chemistry. They analyse data to compute the earth's shape,to estimate its composition and the structure of its interior, to determine the flow patterns of ocean tides and currents, and to help locate petroleum and mineral deposits. They also investigate the origin and activity of volcanoes, glaciers and earthquakes.

They compile data to prepare navigational charts and maps, predict atmospheric conditions, prepare environmental reports and establish water supply and flood-control programmes. Some may study other planets. Solid earth, fluid earth and the upper atmosphere are three general fields of study for geophysicists. Geophysics is connected to a number of techniques which can be employed to solve a specific problem. The most important of these are the gravity technique, the magnetic method, seismic techniques, electric and electromagnetic methods and radiomagnetic methods.

HERPETOLOGIST

A herpetologist is a zoologist who specialises in the study of reptiles and amphibians, for example snakes, lizards, crocodiles and frogs. Herpetology can be split into two broad categories: basic herpetology, which is the study of reptiles and amphibians for its own sake, and applied herpetology, which entails applying the information gained in basic herpetology to a particular situation.

A basic herpetologist studies the origin of these animals, their interrelationships with other species, relation to the environment, behaviour, growth and development, genetics, and distribution. Basic herpetologists also work in museums as taxonomists where they are responsible for naming and classifying species.

Applied herpetologists work as curators of reptile parks or in the reptile sections in zoos, and in other positions where they manage the breeding of reptiles and amphibians. They also work in positions where they are required to educate the public in respect of these species.

HORTICULTURIST

Horticulturists seek to enrich the beauty of a city, town or suburb and provide better recreation facilities. They try to improve the quality of plant varieties such as fruit trees, vegetables and flowers.

Their work can be divided into four different spheres (1) in parks and decorativeareas where they act as parks administrators and are concerned with layouts and cultivation of plants in landscapes, parks and public gardens, (2) in commerce where plants are propagated and seeds produced for marketing by nurseries, (3) in supplementary products where they work as researchers, advisers and salesmen of chemicals, fertilisers and horticultural elements, (4) in research where they attempt to develop improved varieties.

They also work on environmental and pest control. The horticulturist scientist's work involves his working closely with engineers, landscape architects, environmental conservationists and town planners.

HYDROLOGIST

Hydrologists study and do research on the waters of the earth, and on their distribution on and below the surface of the earth, as well as in the atmosphere.

They try to secure the optimal utilisation of the country's water resources by advising civil engineers on the flow of rivers and on where to build the most economical water schemes. They also advise design engineers on the frequency and magnitude of floods in order to minimise flood risks and to ensure the best operational procedures for flood control and during drought periods.

They identify underground water resources, evaluate the effect of man's activities on the quantity and quality of water, and study the interaction between components within the hydrological cycle.

ICHTHYOLOGIST

Ichthyologists are life scientists specialising in the study of fish. They specialise in one of the following areas: aquaculture which is the study or practice of fish farming and management; fisheries science, which entails the study and management of harvesting fish for human consumption; and conservation. Most ichthyologists have varied and interesting jobs, working both in the field and the laboratory. Less time is spent in the field in the more commercial sectors of the industry, such as fisheries science.

LEATHER CHEMIST

A leather chemist applies his or her knowledge of chemistry, biochemistry and microbiology to the process of tanning leather, that is converting raw animal hides into leather. The process entails the preservation of the hides, tanning of the hides and finishing of the leather. Leather chemists learn to process any type of leather and how to use the tests that determine the quality of the leather.

MARINE BIOLOGIST

Marine biologists study the animals and plants that live in the sea. They look at how the organisms interact with each other, their distribution and the effect of various environmental factors: both natural and those that can be attributed to humans on their environment. The aim of these studies is to reach an understanding of marine life and, by doing so, ensure that the sea continues to yield its valuable food supply.

The field of marine biology is roughly divided into research and technical work. Researchers study the marine system as a whole or focus on a particular marine species. Technical marine biologists are more involved in tasks such as collecting samples, building and testing equipment and analysing data. Marine biologists are concerned with the effects of pollution on marine life, the effect of introducing commercially imported species into the waters, identifying ecologically sensitive areas and assisting in establishing the ecological effects of projects like the construction of harbours and piers.

MARKET RESEARCHER

Market researchers help companies to improve their products and increase sales potential.

They are concerned with the factors affecting marketing activities, which may vary widely. They collect, analyse and interpret data to determine the appeal of products or services, study the effectiveness of company advertising and advise management on sales and distribution policies.

They conduct surveys to determine the acceptability of new products, comparing these with existing and competitive items, and making suggestions regarding packaging and product names. Market researchers also make detailed studies of sales records to determine peak periods and trends, to help plan sales campaigns and set reasonable goals.

The market researcher works closely with the marketing manager. He provides the marketing manager with the information required for the decisions-making process. At some companies the work of the marketing manager and market researcher is done by one person, who is usually called the marketing manager.

MATERIALS SCIENTIST

Materials scientists study the structures and properties of various materials such as metals, alloys, ceramics, semiconductors and polymers, to obtain research data. The purpose of these studies is to understand and characterise materials and to develop new materials for commercial and scientific benefit. The financial yield of selling end-products or finished products is generally much higher than selling natural resources that are still in ore form. The primary function of the materials scientist is to find and develop creative and economical ways of converting natural resources into end-products. This covers a very broad spectrum and materials scientists are to be found performing a range of different functions in various industries.

Materials scientists usually specialise since there is such a wide variety of environments in which they can apply their knowledge and skills. Some of theses areas include the following: guiding technical staff in developing materials for a specific use in a projected product; mining and processing materials; extracting certain elements from minerals; processing minerals into materials such as metals, ceramics and plastics; using materials in engineering structures; disposing of waste materials; managing a furnace or rolling mill; and conducting laboratory experiments in the production of materials to confirm the feasibility of processes and techniques for potential users.

MATHEMATICIAN

Mathematicians fall into two broad categories. Theoretical mathematicians advance basic theoretical knowledge in mathematics by developing new concepts and principles and new relationships between existing concepts and principles.

Applied mathematicians develop theories, techniques and approaches to solving problems. They determine the most effective methods for the solution of these problems by the application of relevant mathematical principles. They may use mathematical theory to design and improve statistical methods for collecting and analysing numerical information and estimating unknown qualities.

The work in these two categories often overlaps. Mathematicians may teach in schools, colleges or universities. They try to find solutions for problems within a wide range, for example medical-, agricultural-, engineering-, ecological and genetics research.

MEDICAL PHYSICIST

see page 18

METALLURGIST / METALLURGICAL ENGINEER

Metallurgists are also known as metallurgical engineers or material scientists. Metallurgy is the art of extracting metals from ore and forms an essential part of the mining effort.

Extraction technology is able to determine whether a mineral deposit is worth mining. This is the field of the metallurgist, or metals expert, who uses physical and chemical means to free metal from ore. He refines the metal and ultimately blends it with other metals to meet the alloy requirements of modern industry.

The graduate metallurgist can choose between becoming an extractive metallurgist in the mining industry, or joining one of the metal-processing industries, though the dividing line between extraction and processing is not easily made. Apart from producing metal products the metallurgical engineer must also be able to determine the cause of defects in metals and prescribe possible solutions.

METEOROLOGIST

A weather service is basically a scientific service and the rendering of an efficient service is the primary aim of the Weather Bureau. In this century of rapid technological development, equipment with an increasing degree of sophistication - such as meteorological satellites, automatic weather stations and powerful electronic data processing systems - is being used to capture and process meteorological data. The meteorologist is responsible for the operation of these computerised systems.

Management is therefore an important function of meteorologists who must ensure that the Weather Bureau keeps pace with scientific and technological developments, that high standards are maintained and that its staff receives the necessary training. Meteorologists must therefore be well trained academically and conversant with meteorological practice.

Meteorologists usually specialise in one of the following disciplines: dynamic and synoptic meteorology, numerical weather prediction, physical meteorology, the microphysics of clouds and climatology.

MICROBIOLOGIST / BIOTECHNOLOGIST

The work of the microbiologist/biotechnologist is to study microscopic organisms such as bacteria, algae, or fungi. These scientists isolate and grow organisms for close examination under microscopes to determine where these organisms occur, what they do, which are harmful and which are beneficial to man. Tasks are determined by the type of employer. They may for example study the appearance and activities of harmful organisms in food to determine whether these foodstuffs are fit for human consumption.

A medical microbiologist/biotechnologist may try to isolate an organism responsible for causing a certain disease and, after research, try to develop a vaccine to prevent the disease, or antibiotics to treat it. Microbiologists/biotechnologists employed by industries may be involved in product and process control. Some microbiologists/biotechnologist do research or teach. Some are responsible for administrative duties such as the supervision of laboratory personnel.

MINERALOGIST

Mineralogists study minerals in terms of their form, crystalline structure and physical and chemical properties. Apart from this study, they may also apply their knowledge in the applied fields of geological exploration, metallurgical extraction, civil engineering, the fire-resisting materials industry, ceramic manufacture, cement production and building research.

Petrographic microscopes are used in the research for the analysis of reflected light from polished surfaces of opaque minerals, and light shining through transparent/translucent minerals or finely ground mineral powders. If microscopic analysis does not give exhaustive results, x-ray apparatus and electron micro-analysis are used.

NUCLEAR SCIENTIST / NUCLEAR PHYSICIST

The field in which nuclear scientists and physicists work covers a broad range of activities, from designing and monitoring nuclear power plants to developing medicines and equipment to help diagnose and treat medical problems. The work in this field is seldom routine and calls for a high degree of original thought. It is also highly complex, entailing the use of very sophisticated electronic equipment and computer-controlled systems, so scientists generally specialise in one or other aspect.

The various specialisations in nuclear sicence and physics include the following: basic and applied research in nuclear physics and chemistry, radiation physics and biophysics, medical physics, health physics and nuclear energy; the production of radioisotopes by means of nuclear reactors for use in medical treatment, the sterilisation of medical equipment, the extension of the shelf life of fresh produce, determining position and size of organs and tumours and investigation of the movement of air, tides, sea currents and sand to control pollution; the purification of irradiated material; the development of techniques to analyse samples which are of industrial, mining, geological or archaeological interest; and the observation, measurement and control of radioactivity and radiation.

OCEANOGRAPHER

The oceanographer studies the physical and chemical properties of the ocean. This work comprises geological, geophysical and geochemical surveys, as well as research into the dynamics of ocean currents, the interaction between wind and waves, and temperature and humidity on the water surface.

The five branches of oceanography and their fields of study are:

-marine biology (study the occurrence, distribution and development of plant and animal life)
-physical oceanography (studying the physical properties of the ocean - such as the temperature, salt content, waves and sea currents)
-marine geoscience (studying underwater land formation and physical composition of the ocean floor)
-marine chemistry (studying the chemical composition of sea-water and the reactions of chemicals on the sea environment; also looking at how pollution influences the sea environment), and coastal and ocean engineering (concentrating on the development and maintenance of harbours, inlet pipes for sea water and the management of coastal areas).

ORNITHOLOGIST

An ornithologist is a scientist specialising in the study of birds. Ornithologist study the behaviour of birds and fluctuations in bird populations. Most of the information gained in this research is applied to conserving rare species of birds and educating the public. Education can take the form of museum work - talks, displays and answering queries - or it can entail the ornithologist going into communities and educating farmers in respect of conserving or controlling the bird populations on their farms.

PAINT TECHNOLOGIST

Paint technologists apply their knowledge of analytical chemistry to the tasks of analysing, testing and researching paint.

Technologists working in the analytical field need to acquire an in-depth knowledge of the chemical and physical properties of the numerous colour pigments, solvents and binding agents available. They also need to be familiar with the equipment used in the manufacture of paint. Paint technologists who work on the testing side of this field test paints for various qualities, including their application, drying and resistance to water decay and corrosion. They also test the success of substituting new elements in paints when materials become too expensive or difficult to obtain.

The most experienced paint technologists usually move into research, where they study existing and develop new products, for the benefit of both the consumer and the paint manufacturer.

PALAEONTOLOGIST

A palaeontologist is a scientist who specialises in the investigation of fossils. By studying the markings on stratified rocks and fossilised remnants, palaeontologists have been able to establish, with amazing accuracy, a record of the evolution of life through geological time.

Palaeontologists combine their findings with those of other scientists such as geologists, geographers and meteorologists, to reconstruct a progressive history of life on earth since ancient times. Geologists have been able to use the fossils to work out the order and the age of the rocks. It is due to the work of palaeontologists that we now have some knowledge of what led to the extinction of certain species and the origin of others, and that we have a fairly accurate picture of ancient plants and the great dinosaurs that once roamed the earth.

PHARMACIST

see page 19

PHYSICIST

A physicist is a scientist who studies the physical world. Physicists study the fundamental properties of matter. These ranges from the microscopic world of subatomic and molecular particles to the macroscopic world of cosmology and astrophysics. Systematic observation and experimentation provide the data from which theories describing the fundamental forces and laws of nature can be developed.

Physicists may specialise in nuclear physics, the physics of condensed matter, environmental physics, medical physics and biophysics,solar-terrestrial physics, astronomy and astrophysics, and engineering physics, etc. They do basic research to increase scientific knowledge or do directed applied research to develop new improved materials or products. Many physicists combine physics and related sciences e.g. biophysics or geophysics. Physicists also teach in secondary and tertiary educational institutions.

PHYSIOLOGIST

see page 19

SILVICULTURIST

Silviculturists are managers dedicated to long-range conservation practices. They protect our natural flora and fauna and produce a sustained yield of timber by cultivating indigenous forests and through afforestation with species to ensure the country's self-sufficiency in respect of its timber, wood and pulp requirements.

Silviculturists manage state and private plantations, nurseries and indigenous forests. They also plan and manage catchment areas, nature reserves, wilderness areas and drifting sands. They institute and manage recreational facilities and hiking routes. Some are responsible for timber conversion plants and for research on all the aspects of forestry, such as timber technology, tree breeding, forest entomology and tree pathology. Some may teach or advise on afforestation.

SOIL SCIENTIST

A soil scientist applies his or her knowledge of soil properties to the task of determining what particular types of soil are capable of yielding, and what effect alternative practices will have on soil productivity. Some of the duties he or she performs include classifying soils according to standard types, conducting experiments on farms to determine the best soil types for different plants, analysing soils to establish their chemical and mineralogical relationships to plant growth, and investigating the effect on different soil types of tillage, fertilisation, crop rotation and environmental factors, including pollution.

A soil scientist works both in the laboratory and in the field. He works closely with other agricultural experts and with farmers, ensuring that his knowledge and research are utilised to improve soil-management practices. Soil scientists can specialise in soil classification, soil mineralogy, soil biology, soil chemistry, soil physics, soil fertility and soil decay.

STATISTICIAN

Statisticians may work in either the academic (research) or the practical (applied) field.

Academic statisticians generally have exceptional mathematical ability and usually possess doctoral degrees in statistics. They are primarily concerned with the training of students and with basic statistical research in a chosen specialised field. They are usually involved in developing or refining theories.

Practical statisticians work mostly in research institutions and private organisations, where they help plan and devise experiments or projects to collect and analyse information. They may work in fields such as engineering, chemistry, medicine, psychology and agriculture. Typical examples of projects are the following determining the efficiency of a certain drug in medicine, or a fertiliser in agriculture, or determining the profitability of a particular breed of cattle in a special area.

SYSTEMS ANALYST

The systems analyst determines whether an undertaking can profit from the use of a computer. He analyses the undertaking's requirements, in order to design a system, writes a comprehensive programme and system specifications, and consults the users of the system to ensure higher production. Systems analysts develop methods of using computers to solve problems.

First, they discuss needs or problems with management or with specialists to determine the exact nature of the problem. They collect, organise and evaluate all relevant information for fulfilling these needs and solving these problems.

With this knowledge they devise ways to get the data into the computer and define the computer process needed to turn the raw data into useful information. Systems analysts also have to decide how the data will be stored and how to apply the results of computer processing. Finally, they check the whole operation to be sure it functions properly and they correct errors. In small organisations, systems analysts may also perform programming duties.

WEATHER OBSERVER

The primary function of a weather observer is to observe weather conditions every day at scheduled times, compile the information into meteorological messages according to international codes and transmit it to different centres. Weather observers measure temperature changes, humidity, atmospheric pressure, and wind speed and direction twice a day. They use precision instruments to assist them in their tasks and transmit the data by means of a radiosonde - a sophisticated piece of equipment that makes soundings well into the stratosphere. Weather observers are also responsible for ensuring that this precision equipment is kept in working order.

WINE-MAKER

A wine-maker (oenologist) directs and co-ordinates all the activities of the production of wine in a winery. He contracts with growers to provide grapes for processing or, if the winery is attached to a vineyard, works closely with the viticulturist (the person who cultivates the grapes) to determine whether the grapes are ready for processing into wine. The winemaker is responsible for overseeing the testing and crushing of the grapes, for fermenting the juice, for fortifying, clarifying and ageing the wine, and for finishing the wine - which includes cooling, filtering and bottling.

The wine-maker blends wines according to formulas or knowledge and experience in wine-making. Although modern wine-makers have access to laboratory equipment to assist them in blending, the sensory aspect of tasting for selection in blending still remains a vital part of the process. Wine-making is therefore both a science and an art.

Wine-makers may also be called upon to present their wines personally to various markets.

WOOD SCIENTIST

A wood scientist conducts research into the composition, properties, behaviour, utilisation, development, treatments and processing of wood and wood products.

He applies the knowledge gained from analysing the physical, chemical and biological properties of wood to developing and improving technologies for processing wood into pulp, paper, building and construction timber, chip, fibreboard and laminated beams. Wood scientists usually specialise in specific areas such as research, quality control, marketing and sales, materials engineering, management, administration, manufacturing, production, and process development.

ZOOLOGIST

Zoologists study the origin, growth and development, structure, environment, classification, behaviour and life processes of animals. Because this field is so broad, zoologists usually specialise in a type of animal or animal family, or in certain aspects of animal life, such as in genetics or animal classification.

Some zoologists study live animals in controlled or natural settings, while others dissect animals to study their anatomy and physiology. Zoologists may do research into the diagnosis, the prevention and the treatment of both animal and human diseases. Some zoologists work as consultants or curators for zoos, aquariums or wild life parks. Tasks are determined by the zoologist's speciality and by the employer.

Ecologists study animals in their natural habitat to observe how they adapt to conditions, how their numbers are controlled and how they fit into the community of other animals, plants and bacteria of which they form a part. Physiologists are interested in the way in which the organs of an animal's body function.

Nature (plants and animals)

AGRICULTURAL EXTENSION OFFICER

The primary responsibility of an agricultural extension officer is to keep farmers informed in respect of new developments in the agricultural sector. He or she encourages the farmer to adopt new, improved methods of farming. The agricultural extension officer uses a variety of methods to reach the farmer. These include organising study groups for farmers, 'farmer days', demonstrations, lectures and literature, as well as informing the media. He also makes personal visits to farmers to discuss new developments.

AGRICULTURAL INSPECTOR

see page 14

AGRICULTURAL TECHNICIAN

Agricultural technicians assist agriculturists, farmers and ranchers with a variety of tasks related to different aspects of agriculture. These include planning, research and the application of agricultural knowledge. They help farmers and other land managers to make the best use of their land without damaging it. They may suggest terracing land in the event of erosion or growing hedges to act as windbreaks. Some serve as technical advisers to soil and water conservation committees. On the cattle farming side, technicians assist veterinary surgeons and guide and assist farmers and ranchers in the treatment of diseases and the general handling of animals. They also instruct on the classification and grading of skins, wool and mohair.

There are three types of agricultural technicians research, extension and resource. The agricultural research technician assists the agricultural researcher with research projects. The agricultural extension technician collects information to identify shortcomings in the farming industry and the misuse of resources. The agricultural resource technician is concerned with the classification and mapping of a region's natural resources, the planning of farms and the misuse of resources.

ECOLOGIST

- see page 21

ENTOMOLOGIST

- see page 21

FARMER

Farmers combine agricultural and business methods in operating small or large farms. Their objectives are to make their farming activities productive, profitable and professional. On small farms they may perform the actual labour and also plan and direct farming operations. On large farms they perform a wide range of duties, such as determining land use, planting, fertilising, spraying, cultivating and harvesting procedures.

They direct the care and feeding of livestock. They evaluate existing practices as well as suggestions for improvement. They maintain financial records, determine labour needs, and hire and supervise workers. The topography, climate and vegetation of an area determine the type of farming practised.

The farmer is also responsible for managing his work force and performing a number of administrative duties like bookkeeping, the buying of supplies and the selling of products.

FORESTER

A forester's activities vary according to his working area. All foresters, however, aim to protect trees and help to manage their utilisation.

The majority of foresters are placed at forests or plantations where they initially serve as assistants and later as foresters in charge. At a plantation their duties include the raising of seedlings in a nursery and the planting of trees. They also co-ordinate and assist with the pruning, thinning and felling of trees, the sawing of felled trees into logs and their loading. They burn firebreaks and protect the forests against fire and damage. They may have to maintain roads, erect buildings and maintain telephone lines.

In a conservation area foresters are responsible for conserving the fauna and flora, as well as the soil and water resources. They also manage and plan recreational activities like hiking and picnicking in these areas. Foresters also conduct research to ensure the preservation of trees. Other foresters may work as security and training personnel, educating the public about the importance of trees.

HORTICULTURIST

- see page 22

ICHTHYOLOGIST

- see page 22

NATURE CONSERVATIONIST

The primary objective of a nature conservationist is to conserve and manage natural resources. This general task may be broken down into the following aspects managing the animal populations and the environment in designated nature reserves; enforcing conservation laws, which includes dealing with poachers; environmental education programmes; creating inventories of fauna and flora resources; conducting environmental-impact studies for developers; investigating wildlife management problems; drafting management plans for conservation areas; developing publicity material and liaising with the media; personnel administration, labour relations, administering relevant legislation and permits, and financial administration.

ORNITHOLOGIST

- see page 23

TIMBER / WOOD TECHNOLOGIST

Timber technologists are essentially trained to function as line managers in saw mills or other timber processing plants. They apply their practical and academic knowledge of timber and timber processing technology to the process of converting raw timber to saleable products like plywood or particle board, thus ensuring quality standards and efficiency.

A timber technologist needs to acquire expertise in a number of different aspects of the industry, including the acquisition of timber, the storage of raw materials and end products, the conversion of raw materials, transport, the management and training of staff, cost control, plant safety, quality control, and equipment maintenance. Qualified timber technologists normally begin their careers in junior management positions and progress to senior management as they gain experience.

WINE-MAKER

- see page 24

WOOL-CLASSER

The primary responsibility of a wool-classer is to ensure that wool is sorted straight after shearing according to the classifications set by the National Woolgrowers' Association of SA. In addition he must oversee and co-ordinate the whole shearing process by liaising with the wool farmer, shearing team and other woolworkers.

Nursing & Caring

AMBULANCE AND EMERGENCY CARE WORKER

Ambulance and emergency care workers resuscitate and stabilise the condition of critically ill or injured persons by applying emergency care prior to transporting them, and ensuring the continuing care of patients en route to hospital.

After a call has been received, these workers hasten to the emergency scene observing traffic safety rules and legislation pertaining to emergency vehicles. Upon arrival at the scene they examine both the patient and the situation to decide upon suitable treatment. They also make the site safe and manage bystanders. The patient is then placed on a stretcher and taken to hospital. They supply a report of the patient's condition and treatment. At the base station they clean the vehicle and replace emergency care supplies.

DENTAL ASSISTANT

Dental assistants work beside dentists while they examine and treat patients. They are not allowed to work on their own and do not have their own consulting rooms.

Assistants see that patients are comfortable, prepare them for treatment and draw their records from the filing system. They hand dentists the proper instruments, keep the patient's mouths clear, and mix solutions, filling and impression materials. They are responsible for the cleaning and maintenance of all dental equipment.

Dental assistants may not take X-rays but are responsible for the developing and filling of the films. Dental assistants also do the necessary clerical work to keep patients' dental and personal details in order.

DENTAL THERAPIST

- see page 17

FIRST-AID WORKER

A first-aid worker is essentially an industrial nurse who renders first aid and subsequent treatment to injured or ill employees at factories, mines, construction sites and other places of employment. Some of the duties that first-aid workers can expect to perform include: sterilising, disinfecting, anointing and bandaging minor cuts and burns; applying artificial respiration or administering oxygen in cases of suffocation or asphyxiation; administering medications such as aspirin or antiseptic solution to relieve pain or prevent infection until the patient can receive professional care; and giving prescribed medicines and treatments for illness.

If the company or mine has an infirmary the first-aid worker changes beds, cleans equipment and generally keeps the infirmary in an orderly condition. First-aid workers also assist doctors who are called out to attend emergency situations on site and keep personal and medical records of all employees.

MASSEUR

The main responsibility of a masseur is to massage customers and administer other body-conditioning treatments. Modern masseurs are highly-qualified professionals; the work that they do is very similar to that of health therapists. They use either electronic vibrating equipment or manual techniques such as kneading, rubbing and stroking flesh to stimulate blood circulation, relax contracted muscles, relieve stress or pain and facilitate the elimination of waste matter. Masseurs who acquire skills in specialised massage techniques such as aromatherapy, reflexology and manual lymph drainage are able to serve a wider client base. Masseurs also recommend particular diet and exercise routines for their clients.

NURSE

The activities of a male/female nurse include curative, preventative, promotive and rehabilitative health care for families, communities and individuals. Activities such as the following serve as examples: taking blood pressures and temperatures, handling samples for laboratory tests, applying medication and giving injections, putting in and removing stitches, preparing patients for medical checkups and for operations, applying and changing dressings on wounds, assisting surgeons and anaesthetists during operations, assisting obstetricians in maternity wards and acting as midwives, performing health examinations at schools, caring for the mentally ill in psychiatric sections, and acting as secretaries in doctors' consulting rooms.

Other duties include the managing of wards or departments, the updating and keeping of records, and the ordering of medical supplies and equipment. The qualified nurse also acts as supervisor of student nurses and other nurses who are in training. Nurses work long hours and in some hospitals are required to work shifts.

OCCUPATIONAL THERAPIST

- see page 18

ORAL HYGIENIST

Oral hygienists are concerned with the promotion of oral health and the prevention of dental disease. They work under the supervision of a dentist and may work in a dentist's private practice, or for the Department of Health in hospitals, clinics or schools.

Oral hygienists may perform the following duties: removing stains and tartar (calculi) from teeth and polishing them; -applying decay-preventing agents to teeth; performing diagnostic tests for interpretation by the dentist. They are also capable of taking intra-oral and extra-oral X-rays. Another task is to assist the dentist during dental operations.

The oral hygienist is a professional health educator with his own consulting rooms and should not be confused with the dental assistant, who merely assists the dentist.

PHYSIOTHERAPIST

- see page 19

PODIATRIST / CHIROPODIST

- see page 19

SPEECH THERAPIST AND AUDIOLOGIST

- see page 19

VETERINARY NURSE

The prime responsibility of a veterinary nurse is to assist the veterinary surgeon. The duties that he or she will be expected to perform include the following: assisting at operations; preparing the theatre and the instruments for operations and cleaning them afterwards; looking after animals recovering form anaesthetics; X-rays; physiotherapy; assisting at artificial insemination procedures; and dressing wounds.

Veterinary nurses are usually required to combine their general nursing duties with reception work and basic administration. They have to 'book' patients in, which means making all the necessary enquiries regarding the animal's illness and completing the required documentation. This will usually be done on a computer. They also advise their patients' owners on post-operative care and inoculations.

DIPLOMAT

Diplomats are representatives of their own country in countries to which they are accredited. They note and interpret objectively the political, military, social and economic developments in foreign countries to obtain information of interest to their own government.

They promote exports to the countries where they are stationed. They disseminate information about commercial, economic and industrial conditions and opportunities back home. South African diplomats may renew passports to South Africans abroad, grant visas to foreigners who wish to visit the Republic or entry permits to immigrants who wish to settle here. They strive to build up contacts with foreign states to ensure a constant exchange of views and the establishment of mutual trust, and they negotiate agreements with other states.

ESTATE AGENT

Estate agents show and sell all types of immovable property such as houses, farms, factories, offices and workshops. The estate agent operates as a link between the seller and buyer.

They obtain lists of properties for sale by following leads obtained through newspaper advertisements and personal contacts. Once a property is listed, they must then become familiar with the property so that they can show it to potential buyers. Estate agents interview potential buyers to determine their needs.

Once a buyer has decided on buying a certain property the agent negotiates a price and terms acceptable to buyer and seller. The estate agent helps to arrange a mortgage or other method of payment with a bank, building society or the seller. He does the follow-up work to ensure that the transaction runs smoothly. Once the transaction is complete, the estate agent receive his commission.

INSURANCE AGENT

Insurance agents sell policies to individuals and businesses to provide protection against future losses and/or financial pressures.

Agents must analyse the needs of their clients and help them plan the protection that meets these needs. Insurance protection may be for motorcar, home, business or other property; for protection of a family if the breadwinner dies; or for protection against hospital and medical costs. Insurance agents also provide their clients with information on investment policies and funds. A client may, for example, invest money for his child's education.

Insurance agents also help their clients to obtain claim settlements. In addition, they provide follow-up services to keep their clients' insurance programmes up to date.

MEDICAL REPRESENTATIVE

The main function of a medical representative is to market the medicines, diagnostic tests, dressings and other medical supplies manufactured by the pharmaceutical company at which he or she is employed. Representatives need to set up a disciplined and structured calling system to enable them to pay regular calls to doctors, pharmacies and hospitals, since their target market is the professionals who will prescribe and dispense their products. Increasing the size of the client base is an important aspect of this job.

Medical representatives need to build brand loyalty to ensure that products that have taken several years and a great deal of expense to develop are continuously prescribed. They also need to create brand awareness for new medicines and introduce them in a highly competitive market that is also fraught with controversial issues such as the possible introduction of policies to enforce the use of generic medicines in state medical institutions.

PUBLIC RELATIONS OFFICER

Public relations is a management tool aimed at bringing people together to promote understanding. Public relations officers use every means of communication at their disposal to establish efficient two-way interaction between their companies and other groups of people.

Public relations officers (PROs) help people and organisations gain public acceptance by explaining the aims, objectives and methods of their organisation, and by building and maintaining a favourable image. They gather and give out information for newspaper items, magazine articles and news spots so that the public will be aware of that employer's projects and accomplishments. The PROs also arrange and conduct public contact campaigns which may include setting up speaking engagements, writing speeches, speaking for employers at community functions, planning company conferences and managing fund-raising drives. They may prepare stockholders' reports or work to improve employer/employee relations.

The public relations officer may work in a variety of areas or in one specific field. We can distinguish between the following fields: consulting, community involvement, employee communication, industrial affairs, media liaison, corporate advertising, videos, speeches, organising of special events and crisis communication.

PUBLISHER

- see page 14

TOUR GUIDE

The main responsibility of a tour guide is to escort groups of tourists on bus or minibus trips and provide them with factual and interesting information about the sights they see. A group of tourists has probably previously been on several guided tours, so a tour guide's presentation needs to be dynamic to hold their interest. A tour guide may be allocated a half-day sight-seeing tour or longer tours, in which case he will be responsible for ensuring adherence to the tour itinerary. Tour guides also need to provide tourists with information regarding currency, drinking water, restaurants and tipping. They should always be able to deal with enquiries from the tour group.

TRAVEL AGENT

Travel agents make travel arrangements based on the needs, budgets and tastes of customers. Clients may include individuals, families or groups, and business people.

Agents give information to customers and answer any questions concerning transportation, passports, visas, currency regulations, tourist attractions, hotel reservations and the booking of flights. The travel agent also makes other special arrangements which customers may request, such as car rentals, sight-seeing trips, or traveller's cheques.

Some agents, especially those who are self-employed, do promotional work, such as meetings with business managers to suggest company-sponsored trips. Travel agents work in independent travel agencies throughout the country. Some agents own their own agencies.

Routine Clerical

ARCHIVIST

– see page 11

CHARTERED SECRETARY

– see page 15

RECEPTIONIST

Receptionists officially greet customers and visitors and direct them as to where they have to go. Job duties vary greatly, depending on where they work. The receptionists is usually the first person in a company the client sees or speaks to. It is therefore important that the receptionist make a good impression on the client.

The general duties of a receptionists include answering telephone calls, making appointments, the handling of correspondence, answering enquiries and the filing and completing of documents. We can distinguish between three different types of receptionists.

Dental and medical receptionists arrange appointments and keep clients records. Some handle the payment of accounts. In addition, they see to the sterilisation of medical instruments and keep them ready for use. Receptionists in hotels welcome visitors to the hotel, allocate rooms, and see to it that particulars such as names and periods of stay are entered in the register. They are also responsible for room keys and the payment of accounts. Receptionists (in general business) are the links between the firms and customers. They have to refer clients to the appropriate staff member. They usually work in banking and financial institutions.

SECRETARY

Secretaries keep their employers' offices running smoothly and efficiently. They do the routine tasks so that their employers can attend to more demanding duties.

They take dictation, type letters and documents and handle incoming and outgoing telephone calls. They keep record of office stocks and order anew when supplies run low. They file correspondence and open, read and direct mail. Some secretaries collect mail from post offices and make bank deposits. They may arrange dinners for management and make travel and hotel reservations. Some may handle personnel files and arrange interviews between employees and management. The reception of clients and bookkeeping are additional tasks.

WORK STUDY OFFICER

The task of work study officers is to give advice on organisational and work procedures in order to raise efficiency. To do this they observe the workers and work procedures to determine the amount of time and the movements needed to perform each task. They then analyse the data and recommend changes to make the work simpler and more effective.

They classify work and develop means of measuring productivity and suggest incentive schemes. They investigate computerisation, new filing systems and labour-saving devices. They may suggest rearranging or decreasing the number of workers, setting new standards of performance, or the most effective use of accommodation. Recommendations based on their research findings are presented to the management.

Routine-Numerical

ACCOUNTANT

Accountants are at the focus of all business activities. Their main responsibility is to analyse and evaluate financial information and effectively communicate the results to senior management to enable them to make good business decisions. Very often an accountant is part of the senior management team, in which case he or she will use the information to make decisions, convince his or her senior management colleagues of a certain course of action and then implement that action. The services of accountants are indispensable in today's business world as they provide the knowledge and skills that enable businesses to run effectively.

This pivotal role in business is the reason that many accountants rise fairly quickly to senior management positions. Chartered accountants, because of their rigorous training, are the accountants most in demand. Accounting graduates with lower qualifications will probably work as accounting officers and will not usually rise to the same levels of seniority.

Accountants can specialise in any one of the following fields of accountancy: auditing, pure accounting, taxation, legal accounting, financial accounting, management accounting, computer accounting, cost and management accounting.

BANK OFFICIAL

Banking started because man needed to keep his money safe. Presently it has expanded to fulfil man's every need in money management and financing.

People in banking thus work in a variety of capacities. Bank tellers deal directly with the public in cashing cheques and handling deposits and withdrawals from accounts. Other staff members manage the different departments such as credit, trusts and wills, shares, marketing, and foreign exchange, advising and serving the public in these fields. Bank managers are responsible for the functioning of the bank and the development of new business - corporate, retail and personal.

CHARTERED ACCOUNTANT

The chartered accountant examines the financial information of individual clients, corporate clients and other institutions. Based on his findings the chartered accountant suggests possible ways in which his clients can run their business better, and protect their investments.

When a company is in financial difficulty it is one of the chartered accountant's roles to see that the company pays all its outstanding debts and looks after its employees. It is also his task to deal with the tax- and accounting systems of the company.

His work setting may change from day to day. The chartered accountant works in an office, but is also involved with all the critical areas of a business operations, from accounting to the making and selling of the product and even the marketing.

COST AND MANAGEMENT ACCOUNTANT

The function of a cost and management accountant is to prepare and present accounting information, to assist management in the formulation of policies and the planning and control of the operations of a manufacturing industry. He is concerned with the economic viability and future planning of a company, with the emphasis on the manufacturing operations.

Cost and management accountants apply accounting and costing principles, methods and techniques, as well as economic principles, to determine costs and the analysis of savings/excesses compared with previous experience or with budgets. Management will require an update of this information at regular pre-determined intervals. Compiling the information also entails examining factors such as the under-utilisation of a plant, low productivity and the cost of holding excessive materials or stocks. The other aspect of cost and management accounting is to provide the management with analyses and figures that will enable them to make forecasts in respect of the profitability of new products, processes and expansions.

CREDIT MANAGER

– see page 15

INTERNAL AUDITOR

An internal auditor is the person who examines and vouches for the accuracy and completeness of bookkeeping records and the financial statements of any business establishment. He independently appraises functions within an organisation to examine and evaluate these activities as a service to the organisation.

He provides the management of the organisation with analyses, appraisals, recommendations, counsel, and information about the activities he reviews. He analyses compliance with policies, procedures and practices, and also evaluates established controls, and appraises the efficiency, effectiveness and economy of operations.

In addition, he identifies, evaluates and handles risk. He may prepare financial statements for a client, such as profit and loss statements and balance sheets. He also prepares detailed reports showing items such as operating costs, total assets, liabilities, volume of sale, net profits and depreciation costs.

The auditor is able to act as a financial adviser due to his wide knowledge, experience and thorough training. He acts as adviser when , for instance, new bookkeeping systems and computers are introduced and advises companies and individuals on aspects concerning taxation, legal matters and finances.

STOCK CONTROLLER / INVENTORY AND STORES MANAGER

– see page 16

STOCKBROKER

– see page 16

VALUER / APPRAISER

In general, valuers or appraisers establish the monetary worth of property, merchandise, business assets, objects d' art, precious stones, motor vehicles and household effects. In recent years the term 'valuer' has been used to describe a person who determines the value of immovable property, while the term 'appraiser' is used to describe a person who determines the value of any property, merchandise, goods and assets for purposes of managing deceased estates.

Valuers and appraisers use the most readily available comparable facts and examine goods for conditions and authenticity. Valuers may provide information for the parties concerned with the sale or expropriation of property, establish the value of security offered for a loan or mortgage, assess the value of properties to enable local authorities to raise rates, ascertain the value of company assets and shares, evaluate the amounts of cover and claims for insurance, and estimates the value of plant and machinery.

Sales

BUYER (RETAIL)

Buyers purchase merchandise that appeals to the public and which can be sold at a profit. To estimate the amount of merchandise needed, buyers examine past and present sales records and keep up with merchandise inventories.

Buyers study their market, confer with managers and sales clerks and watch reports of general economic conditions to help them in ordering merchandise. Buyers must know the quality of the merchandise and the business standards of firms with whom they may do business. They work closely with advertising people to plan sales campaigns and window and floor displays.

ESTATE AGENT

- see page 26

MEDICAL REPRESENTATIVE

- see page 26

STOCKBROKER

- see page 16

Social, Legal & Economic Sciences

ACTUARY

- see page 20

ADVOCATE

Advocates conduct civil and criminal cases in various courts of law by appearing either for a defendant or a plaintiff in civil cases, or for the State or an accused in criminal cases, and also before other bodies such as licensing boards.

Civil action results when the private interest of two parties or persons causes a dispute but where the State and its laws have not directly been violated or affected such as divorces and disputes over contracts and insurance claims.

Criminal cases are instigated by the State against someone who has allegedly violated or committed an offence against the law of the country. Clients do not generally contact an advocate directly, but are referred to him by an attorney who puts the client's case to him with all the relevant information.

AGRICULTURAL ECONOMIST

Agricultural economists are concerned with the economic aspects of the agricultural sector industry. Their main responsibilities include finding ways of increasing production and analysing the costs and benefits of distributing and consumable goods and services.

Conducting research on economic trends such as energy costs, inflation, interest rates, imports and exports and employment is another important aspect in this field of work. Agricultural economists are also responsible for marketing, production, financial management and policy implementation and evaluation. They specialise in the fields of production economics, financial management, agricultural marketing, agricultural policy, agricultural development, operational research and agricultural environmental economics.

ANTHROPOLOGIST

Anthropologists study customs, judicial systems, the economies of human groups, social and political organisations and the changes that cultural and social groups undergo through contact with each other. Such data may be applied to solve problems in human relations, social work, education, health, poverty and underdevelopment. The anthropologist makes comparative studies relating to human origins, evolution, races, and the cultures they have created, as well as the distribution and physical characteristics of human beings .

This occupation is further concerned with research into the cultural and social development of civilisations, as well as the cultural and social development of specific peoples and changes that occur during their historical development. Anthropology is the total study of human origins, development and social interaction using a holistic approach and mainly qualitative research by means of participant observation.

ARCHAEOLOGIST

- see page 20

ATTORNEY

Attorneys, also known as lawyers, give legal advice to their clients regarding rights and obligations. They may also serve businesses, institutions, local authorities, the government or individuals.

Although attorneys' specialities determine their actual duties, basic activities are performed by most lawyers. An attorney or lawyer appear in court on behalf of his client. He therefore needs to consult with clients to determine the nature of their problems and then give advice. These activities may fall into one of three main categories: acting as agents: representatives of any person in an action in a court of law by pleading or arguing a case whether civil or criminal - drafting legal document, and administering deceased estates and clients' affairs.

An attorney can handle civil or criminal cases for his client. Civil cases are cases in which attorneys, for example, assist clients with contracts, leases, wills and trusts. Criminal cases are cases in which attorneys act on behalf of clients who are, for example, charged with murder or theft.

CRIMINOLOGIST

A criminologist is a sociologist who specialises in research into the relationship between criminal law and social order in the causes of crime and the behaviour of criminals. Sociological research entails the collection of information and the analysis and interpretation of data that are collected through surveys, in-depth interviews, case studies and other methods.

ECONOMIST

Economists analyse and describe the relationship between the supply of and demand or goods and services. They also study how the goods are made, supplied and used.

Economists also describe, analyse and advise on a wide range of economic data. Some work in specific fields - such as tax or wage problems and economic policies, - while others attempt to develop theories explaining the causes of unemployment and inflation. Some economists serve as consultants to businesses, individuals and government departments. Government economists assess economic conditions in the country and abroad and recommend changes in government policies, if necessary. Some economists are attached to particular manufacturing organisations, where they advise management on production and marketing.

HISTORIAN

Historians use their knowledge of the past to attempt to explain current events. Historians involved in research evaluate any evidence they obtain, such as photographs, letters or verbal accounts of events to determine their authenticity and value. They then develop theories about the evidence, and present their findings in teaching, lectures or writings.

In addition to carrying out research, historians may teach in colleges or universities or serve as consultants to editors, publishers or radio and television shows or films.

HOME ECONOMIST

- see page 11

INDUSTRIAL ECONOMIST

Economists study the way a society uses scarce resources such as land, labour, raw material and machinery to produce goods and services. Industrial economists focus on the effect that factors such as government economic policy, international trade regulations and labour relations have on the sectors in which their businesses operates. They consider all social, political and other factors - locally and abroad - that have an effect on the economy.

At least four different types of industrial economist can be identified. Industrial economists employed by large corporations on a full-time basis gather information, assess the impact of industrial economic factors on the organisation and advise top management accordingly. Industrial economists at educational institutions conduct on-going research and teach. Their approach to the subject is creative and they may develop original economic theories based on their research. The professional advice of these economists is sometimes sought by large corporations.

Techno-ecnomists are research-orientated and are normally employed by research institutions such as the CSIR. They usually have additional qualifications in a technical or scientific field. Business economists are employed by corporations in the private sector as financial, marketing, production and general managers. It is their responsibility to identify areas of potential benefit and potential disaster and make recommendations to senior management.

LEGAL ADVISER

A legal adviser is a lawyer who is employed by a large company or organisation to provide legal advice and services to both the organisation and its employees.

Lawyers are generally divided into attorneys and advocates.

Attorneys are, in effect, general legal practitioners. They offer their clients services on all legal aspects, including company law, criminal law, taxation, estate planning and personal advice. Attorneys represent their clients in the magistrate's court and generally prepare cases for presentation by an advocate in the High Court.

Advocates specialise in giving legal opinions and presenting cases in court. They generally participate in litigation only when they have been instructed or briefed to do so by an attorney.

MAGISTRATE

Magistrates may be regarded as general practitioners of law. South Africa is divided into at least 300 magisterial districts, with one magistrate's court per district with at least one magistrate, who is responsible for applying the law.

They have two main functions, namely the judicial function and that of district administration. Magistrates preside in both magistrates' and regional courts and have jurisdiction over civil, criminal and juvenile cases. They try cases, return verdicts and impose penalties. Magistrates have no jurisdiction to try cases of high treason and murder. These cases are referred to the High Courts. In cities and large towns magistrate's judicial functions are more specialised. In country districts magistrates often act on behalf of other government departments such as receivers of revenue and registrars of birth and marriages.

MARKET RESEARCHER

- see page *22*

POLITICAL SCIENTIST

Political scientists study different aspects of political behaviour, such as the origins, development, operations and interrelationships of political institutions. They apply this knowledge to formulating and developing political theory. Using information available on governments, laws, political parties and international law, they conduct research into political philosophy and theories of political systems. They analyse and interpret the results of studies and compile reports setting out their findings. Conducting public opinion surveys and interpreting the results is another task that they will probably be called upon to perform.

PSYCHOLOGIST

Psychologists gather information about people's interests, abilities and behaviour in order to be able to understand, explain and predict human actions. Many psychologists are interested in adjustment problems and the results of prolonged stress. They gather information through interviews, experiments and psychological tests. They may help individuals to deal with the problems of daily living, provide psychotherapy or conduct behaviour modification programmes in mental clinics and hospitals, or study human behaviour in terms of the environment or individual development.

It is clear that psychology covers a wide range of topics each with its own distinct characteristics. We identify the following fields in psychology: (1). Clinical psychology - the clinical psychologist usually work in hospitals or in private practice where they provide a service to clients who are experiencing emotional and/or mental distress. (2). Counselling psychology - the counselling psychologist is responsible for counselling clients with everyday problems, such as career adjustment difficulties or marriage problems. (3). Educational psychology - the educational psychologist work in an educational environment where they advise pupils, students, parents and teachers on topics such as academic performance and development strategies. (4). Industrial psychology - the industrial psychologist work in the industrial sector with the main objective of developing the workforce to achieve maximum production. (5). Research psychology - Research psychologists may do research work, and devise, construct and standardise psychological tests. They also present papers or write reports based on research.

PSYCHOMETRIST

Psychometrists work under the supervision of a professional psychologist who is responsible for the eventual counselling, psychotherapy or job placement of clients. Psychometrists carry out the testing and initial evaluation of clients by means of psychometric measuring instruments such as aptitude tests, interest questionnaires and personality inventories. These evaluations enable the psychologist to select the most suitable procedures for counselling, psychotherapy and job placement for individual clients. Psychometrists conduct interviews, make summaries of test scores and keep records and statistical information up to date. They may participate in personnel research projects and in the planning and evaluating of personnel enrichment programmes.

One can conclude that psychomotrists play an important role in the selection of people for a particular kind of job. This selection is done by conducting tests and interviews and consulting with a supervising psychologist on the results of the tests and interviews.

PUBLIC PROSECUTOR

Public prosecutors represent the attorneys-general in all criminal cases in magistrates' courts. It is their duty to protect the public from alleged offenders.

They study police dockets brought before them, and often ask for additional police investigation to build up a complete case. On the basis of the evidence before them they decide if the accused may reasonably be charged and in terms of which law or regulation this should be done. If it is decided to prosecute the accused, they serve summonses on the accused and subpoena the witnesses to appear in court.

Public prosecutors put the case to the court, explaining and arguing all relevant evidence, whether against or in favour of the accused, to ensure that justice prevails. They try to prove the alleged transgression beyond reasonable doubt.

The public prosecutor's work is done mostly in court and in his or her office where research is done on a case. He or she may sometimes accompany the witnesses to the scene of the crime to get more information about the case.

SOCIOLOGIST

Sociology is the science of human relationships. Sociologists study the origins, growth and interactions of human groups - e.g. the family, the community, social institutions such as religious, political and economic groupings, ethnic groups and social classes.

They also study social processes and phenomena such as social change, deviant behaviour, group friction and migration. Research involves the collection (by means of surveys, interviews, case studies, etc.), analysis and interpretation of information and data.

The sociologist can work in a variety of fields: social psychology, clinical sociology, political, economic and applied sociology, and research.

TOWN AND REGIONAL PLANNER

- see page 10

Technical-Engineering & Related Technologies

AERONAUTICAL ENGINEER

Aeronautical engineering can be regarded as a branch of mechanical engineering. Practically all aspects of mechanical engineering are applied in a specialised way into aviation, for example internal combustion engines, fuel, air-conditioning and heating, strength of materials and hydraulics.

The aeronautical engineer is regarded as competent and sufficiently specialised for the development of all aeronautical products. From planning and designing to manufacturing and testing, these engineers usually specialise by area (such as structural analysis, aerodynamics, propulsion, systems, avionics, servo-and power systems,
thermodynamics or acoustics), production methods and type of product. They usually work as part of a team with each team member representing a different area of specialisation.

AERONAUTICAL ENGINEERING TECHNICIAN

Aeronautical (aircraft) engineering technicians work with engineers and scientists to design and produce aircrafts, missiles and spacecrafts. Technicians help engineers to prepare layouts and models of structures, control systems, or equipment installations by collecting information, making calculations and performing laboratory tests. Some technicians prepare or check drawings for technical accuracy, practicability and economy. Others work as manufacturers' service representatives and serve as a link between their company and customers. There are technicians who prepare technical information for manuals, bulletins, catalogues and other literature.

AGRICULTURAL TECHNICIAN

- see page 25

AIRCRAFT ELECTROPLATER

Aviation electroplates have the responsibility of keeping all aircraft parts corrosion-resistant and salvaging worn parts. This is accomplished by depositing a specific type of metal onto the various parts, through a process of electrolysis. Examples of metals which are deposited to protect against corrosion are cadmium plating, copper plating, silver plating, nickel-cadmium plating and LHE-cadmium plating. Examples of metals which are deposited for the purpose of salvaging worn parts are hard chrome, nickel, silver and lead tin plating.
All aluminium parts are iodised to protect against corrosion. Aluminium can also be dyed (or coloured) for identification purposes.

Physics plays an important role in the life of an aviation electro-plater since he has to analyse all the electroplating solutions in the workshop. This is done in the workshop's own laboratory.

The aviation electroplater must ensure that regulations laid down by the manufacturing companies are strictly adhered to. All procedures applied must be accurately documented. Aviation electroplaters may supervise apprentices.

The prospective aviation electroplater will also be introduced to 'selective plating' where electroplating is being done outside a plating bath. This trade covers a wide field and because of the diversity of the various processes the work is very interesting.

AIRCRAFT INSTRUMENT MECHANIC / AIRCRAFT ELECTRONICIAN

Aircraft instrument mechanics maintain and repair mechanical, electrical, electronic and digital instruments on an aircraft. They also maintain and repair precision measuring instruments, pressure switches, various types of gauges, transmitters, indicators, compasses, engine power and control instruments and altimeters. In addition, they repair oxygen equipment, gyroscopic instruments, auto-pilot components and air-conditioning systems.

They join metals, apply cleansing agents and treat metals against rust and fatigue. They repair and maintain certain aircraft parts such as instrument panels, pressure sensors, navigating systems and instrument landing systems. They maintain and use measuring and testing equipment for the tracing of circuits and for measuring circuit values.

AIRCRAFT RADAR TECHNICIAN / RADIOTRICIAN

Aircraft radar technicians / radiotricians install, test, repair and maintain radar and radio equipment for aircraft. They use components and materials such as resistors, capacitors, inductors, transformers, switches, generators, and insulators. They construct and use circuits such as rectifiers, amplifiers and frequency modulators. They mount, connect and tune-in various antenna systems. Testing equipment and measuring instruments are used in tracing faults. These technicians often do the wiring of all the electrical equipment in an aircraft. The following must be checked, repaired and tested radio and electronic equipment, computing equipment, communication systems, radar and radio navigational equipment and air-traffic control equipment.

AIRCRAFT SHEETMETAL WORKER

Aircraft sheetmetal workers manufacture sheetmetal components from which aircraft are assembled. They mark off and cut sheetmetal according to engineering drawings. Various factors such as the metallic properties of the metal must always be taken into consideration. Various shapes are obtained by bending the sheetmetal into the desired form and by joining components together using soldering, brazing, welding, riveting or bonding techniques.

Safety precautions should be strictly adhered to. Sheetmetal workers apply heat treatment to ensure the safe joining of sheetmetal components. They treat all metals to protect them from corrosion. They also shape and fit pipes to aircraft.

AIRCRAFT TRIMMER

The aircraft trimmer has the responsibility of maintaining the high standards of an aircraft cabin interior, in accordance with laid-down specifications, to ensure passenger comfort and safety. He performs scheduled maintenance, makes repairs and completes inspections on aircraft interior-related components such as fabric covered panels, carpets, curtains, cockpit and cabin seat covers, safety belts in the aircraft cabin, cargo webbing nets and aircraft insulation blankets in the aircraft cargo compartments.

Survival equipment such as various slide rafts and life vests used on aircraft, are regularly serviced and if necessary, repaired to ensure the safety of the passengers. All procedures applied must be accurately documented. This trade offers a clean and exciting career.

ARCHITECTURAL METALWORKER

Architectural metalworkers make steel doors, metal patterns, fixtures, templates and railings for architectural purposes. They may make their own designs and sketches, but usually they work under assignment of architects who supply them with drawings.

They mark outlines off on the metal, which can be brass, copper, steel or alloys. They cut and forge metal to the desired shape by means of various machine tools such as metal band saws, power shears, fly presses and swage machines. The metal is heated in a furnace to make it malleable.

Architectural metalworkers use soldering, brazing or welding techniques to join the different parts of the metal pattern together. The architectural metalworkers need to take all the necessary precautions to ensure that all the work is done in a safe and clean environment. They complete their task by fixing the door, pattern or template to the building.

ARCHITECTURAL TECHNOLOGIST

- see page 8

ARMAMENT FITTER

Armament fitters are responsible for inspecting, servicing and repairing firearms, artillery weaponry and weaponry equipment.

In the Defence Force they specialise in the types of weapons used in the units or divisions to which they are attached artillery division you specialise in guns, the armoured corps specialise in tanks equipped with guns, machine guns, bombs and mortars
, the infantry division specialise in rifles, machine guns, grenades and mortars, the air force specialise in fighter aircraft armed with rockets, machine guns and bombs, while the navy specialise in anti-aircraft artillery, torpedoes and missiles.

Armament fitters need a thorough knowledge of a wide range of arms, ammunition, warheads, explosives and specialised weaponry such as hydraulic and pneumatic weaponry systems.

ARMATURE WINDER

Wire coils are among the most important parts of any electrical machine. When the coils of motors burn out or are damaged, armature winders locate the broken parts, remove them and either replace them with new ones or completely rewind all the coils.

They use various kinds of testing instruments to trace burnt-out coils. Armature winders work from diagrams that supply details of the arrangement of coils, the number of turns required of each, and so on. In order to wind coils to the correct number of turns and shape, armature winders make use of coil-winding machines.

They then check the coils, fit them into the slots of motors and generators and connect them according to circuit requirements. They finally assemble these motors and take care not to damage the insulation around the wires, after which the motors and generators are ready for use.

ASSAYER AND SAMPLER

Assayers and samplers work in the laboratories of prospecting, mining, reduction and refining, municipal and industrial organisations. They determine the quantity and quality of elements in ores, process materials, base metals, non-metallic materials, concentrates, effluents and air samples. Their results help their organisations or clients to plan current and future operations more efficiently.

Assayers determine elements in samples using various techniques. They use chemical processes such as fire or dry assay procedures and wet chemical methods. The determination of trace elements requires an exceptional degree of accuracy. Analyses are conducted for metallurgical accounting, process control, effluent control, environmental health and quality control.

AUTOMOTIVE BODY REPAIRER

Accidents involving cars, trucks and buses are happening more frequently then ever before. These cars are repaired by an automotive body repairer or panel-beater.

Automotive body repairers straighten bent frames, remove dents and replace damaged body parts under the direction of a supervisor. They use special machines to align damaged frames, body sections and unit bodies. In some cases badly damaged sections of body panels are removed and new ones welded in their place. Small dents are repaired by smoothing them out or by filling them with plastic or solder. Dents are then filled and sanded for painting.

Automotive body repairers are also responsible for the final assembly and inspection for true fit, as well as for the testing for proper connection and working components in electrical fittings and lights. Although it is expected from the automotive body repairer to be able to repair almost any part of a vehicle, his work is becoming more specialised. In bigger workshops, the automotive body repairer may specialise, for example, in frame straightening, door and fender repairing or the installation of glass.

AUTOMOTIVE ELECTRICIAN

Automotive electricians repair and maintain electrical systems in motor vehicles. Motor vehicles have two electrical systems, namely an ignition system and an accessory system. Automotive electricians are mainly concerned with the accessory system which comprises the starter motor, generator, lights, windscreen wipers, indicators, hooter, etc., as well as electrically-operated windows, aerials and radios.

They should however also have a thorough knowledge of the ignition system since defects in the accessory system may have a detrimental effect upon the vehicle's electrical system as a whole. Automotive electricians do a fair amount of routine work such as replacing bulbs and setting regulators. Specialised work includes tracing faults with special equipment.

AUTOMOTIVE MACHINIST

Automotive machinists are skilled metal workers who perform a variety of machining operations on engines and engine components. They may also build and assemble engines for new vehicles.

When the engine of a vehicle is worn out, it burns too much oil and fuel and has to be rebuilt. This process includes dismantling the engine, grinding various parts and manufacturing and fitting others. The automotive machinist's duties involve turning and fitting the different parts and assembling the sub-structures of the engine, before the engine parts can be balanced.

AUTOMOTIVE SHEETMETAL WORKER

Automotive sheetmetal workers cut and shape sheetmetal components into the correct forms and sizes for the body work of vehicles. They shape cut and rivet sheetmetal, applying heat treatment. They often use electrical and gas welding techniques to join soft steel of different thickness. Before the welding can be done, the material has to be finished off, which involves joining, filing, sanding and smoothing the sheetmetal. Automotive sheetmetal workers often have to draw plans, according to which the parts are cut and put together. It is important that the components fit exactly.

AUTOMOTIVE TRIMMER

These artisans upholster motor vehicle seats, line their roofs, floors and door panels and also install windows, windscreens, back-rest bolsters, trimmings and leather coverings in the interior.

They first remove the door handles and then detach the upholstery and trimmings from the door panels, floor, roof and seats. Thereafter they match, measure and cut new material to the required shapes, sizes and patterns and reupholster the parts concerned. Finally, they replace all hinges, handles and other trimmings, perform any finishing touches that may be necessary to the interior of the vehicle and install seats in the correct positions. They may also work on the interiors of vintage cars.

AVIATION TURNER AND MACHINIST

Aviation turners and machinists have the responsibility to do maintenance work on aircraft parts and components by applying turning, milling, grinding, and jig-boring skills. Machine plasma spray, plating and welding processes including ferrous and non-ferrous materials. In this occupation a person must be able to manufacture parts from various types of materials including aircraft materials. The aviation turner and machinist must adhere to all the prescribed rules and regulations laid down by manufacturing companies and vendors. All machining processes must be documented. All work done will be subjected to comprehensive inspection to meet safety standards.

BIOMEDICAL ENGINEER

See page 17

BLACKSMITH

Blacksmiths make use of modern mechanical tools and other machinery to manufacture objects from steel and metal, for example architectural steel structures, crowbars and picks, to name but a few.

Blacksmiths forge metal parts, to make them into some object or to repair others. This is done by first heating the metal to soften it. When softened, the object is picked up with a pair of tongs and placed on the anvil where it is hammered or pressed into the desired shape. Broken parts are rejoined by hammering them together. Blacksmiths may have to reheat the object while it is being shaped, repaired or finished to keep it workable. They may use this process to sharpen metal or hand tools. They also temper or harden metal by heating the object to a high temperature and then cooling it.

Some blacksmiths (farriers) repair shoe horses using ready-made or custom-designed shoes. Other aspects of their work include making drawings and interpreting these. They should be able to estimate material requirements from the drawings. They are also responsible for preparing, lighting and using open hearth, gas or oil-fired furnaces.

BOATBUILDER AND SHIPWRIGHT

The boatbuilder and shipwright is responsible for building, altering, renovating, repairing and maintaining boats and ships. He is usually provided with a plan and specifications of the boat he has to build or repair. Sometimes however, he only receives general instructions and has to work from his own designs and sketches.

The boatbuilder and shipwright discussed here works mainly with wood. He selects the material he requires for the job, for example timber, plywood and hardboard. He begins by marking off the design on the wood, and then cuts and assembles the various parts in conformity with the drawings. He must be precise in using marking-off tools such as rules, centre punches, scribes and squares.

When all the parts have been shaped, he assembles them by making use of various kinds of joints such as dovetailed, doweled, grooved, lapped and tongued joints. Steam is used to bend the wood. He then glues the parts together and strengthens the joints with nails, bolts, cleats and screws.

He also ensures that the boat is waterproof. He applies filters, sealant and fibreglass and when the construction work is complete all parts are varnished or painted. The boatbuilder and shipwright also does repair work and replaces worn-out wooden parts such as steps and masts. He can work outdoors on a boat that is afloat and/or indoors on a boat which is in a workshop or dry dock.

BOILERMAKER / PLATER

A boilermaker manufactures and builds structures of steel plates, ranging from boilers for steam engines and pressure vessels for power stations and petrochemical plants to mine head gears, bridges and oil drilling platforms.

The boilermaker has to develop a drawing in separate sections and has to make many calculations in this process. Once he has established his job procedure he marks out the plate and cuts it to the correct dimensions, using cutting torches or guillotines. He then bends it into the required shape. This is done manually using hand tools or mechanically by using bending brakes, rolling machines and heating procedures. He then assembles the various parts and prepares them for welding.

It is estimated that boilers last for a very long time. The work of a boilermaker is therefore mostly devoted to maintain and repair boilers. Boilermakers are also responsible for the cleaning and inspection of boilers to ensure that these boilers work effectively.

BOOKBINDER

Bookbinders operate machines which prepare books and other publications for distribution.

Printed sheets are generally folded into sections of 16 or 32 pages, arranged into proper order, and plates are inserted at the assigned places. Next, the book is sewn together and/or the spine glued. Colouring or gilding may be applied to page edges. Other workers may prepare the cover. The cover and book are then put together.

In hand binderies where they specialise in special bindings, original bindings, and the restoration of rare and valuable books, the above-mentioned operations are performed by hand. Other bookbinders make use of specialised machinery, such as folding, cutting, stitching, punching, indexing, assembling and binding machines.

BRICKLAYER

Bricklayers build and repair walls, floors, partitions, fireplaces, chimneys and all other structures made up of brick, concrete block or masonry materials. They may specialise in one type of masonry material, such as firebrick or cinder block work.

Bricklayers first study the blueprints to check specifications and determine the most accurate layout. Mortar is then mixed and a layer or bed of mortar is spread as a base after which bricks are positioned by hand to assure a neat, uniform appearance. Excess mortar is cut off. Mortar joints are then finished off so that moisture cannot penetrate.

Bricklayers have a thorough knowledge of the different types of bricks that are available, also of the correct mortar mixtures and of how to adapt their methods to different weather conditions. Bricklayers may also weld metal supports for bricks. In addition, they may supervise helpers.

BUILDING SURVEYOR

Building surveyors apply their measuring and surveying skills to various tasks required by building contractors and quantity surveyors. They measure the building work that has been completed on site by means of a very specific system which is standardised throughout South Africa. The information that they obtain from measuring the work is used to issue monthly certificates and also to determine whether the company is running at a profit.

Before the commencement of a building project, an estimate as to the cost is made by a professional quantity surveyor. This estimate is presented in the form of a complete list of all the items necessary to complete the project and is known as a 'bill of quantity'. The building surveyor then analyses the bill of quantity and prices all the items such as materials, labour and plant. In this way he arrives at a tender amount, which the building contractor's firm at which he is employed submits as an offer for the building contract.

A building surveyor can also work for a quantity surveyor where he will assist the quantity surveyor in measuring the builders' work, compiling bills of quantity, issuing monthly valuation certificates, measuring variations and preparation of the final account.

CABINETMAKER

Cabinetmakers build and repair wooden cabinets and high grade furniture, using a variety of woodworking machines and hand tools. They may work in a workshop or on the site where the cabinets will be installed.

They study blueprints, plan the order of operations, mark outlines of parts on paper or timber according to specifications and match materials for colour, grain or texture. They set up and operate machines such as power saws, jointers and mortisers to cut and shape wood. They trim parts to ensure they fit tightly, using hand tools. They drill holes for screws or dowels and glue, and fit and clamp parts together to form complete units. They sand and stain articles and install hardware such as hinges, catches and drawer knobs.

CARPENTER / JOINER

The carpenter does the finer work of putting the finishing touches to a building. He erects panels and picture rails, makes built-in cupboards and installs carved ornamental woodwork.

Work proceeds according to sketches made by draughtsmen or architects. The carpenter decides on the type of wood required and marks off, saws and joins the pieces. As soon as the walls are high enough to support doors and window frames they are built into openings left for this purpose by the bricklayer. After the frames have been installed the carpenter fits the doors. The carpenter joiner then completes the work by fitting locks and bolts.

He is required to lay down wood and block flooring, fits kitchen dressers to walls, and does repairs to damaged woodwork in buildings. Carpenters work closely with other construction workers like bricklayers, plasterers and tilers.

CARTOGRAPHER

– see page 20

CHEMICAL ENGINEER

– see page 20

CHEMICAL LABORATORY TECHNICIAN

– see page 21

CIVIL ENGINEER

Civil engineers are responsible for the planning, design, maintenance and management of construction projects. These projects are concerned with the construction of multi-storey buildings, roads, bridges, harbours, airports, sports stadiums and water and sewage purification.

Civil engineering involves the constant re-creation, improvement and conservation of the environment, as well as the establishment of the facilities required for the effective functioning of the community. Civil engineers design major structures and oversee their construction. They supervise surveyors, draughtsmen, technicians and other workers.

Civil engineers may also carry out research or teach at technikons and universities. Some serve as consultants for engineering, construction or architectural firms. Civil engineering is a very broad field and engineers usually specialise in one of the subdivisions or in one area of the work. The following fields can be distinguish geotechnical-, transportation-, marine-, municipal-, construction-, structural-, hydraulic engineering, and project management.

CIVIL ENGINEERING TECHNOLOGIST

A civil engineering technologists assists civil engineers in the construction of large structures such as roads, bridges, airports, buildings and dams. His function is to liaise with the engineer on a theoretical and technical level and to liaise with the construction workers on a practical level.

A civil engineering technologist's work will vary widely according to the field of civil engineering he works in. Civil engineering can basically be divided into two basic activities planning and design and construction and maintenance. These two activities can be further sub-divided into various fields of civil engineering, namely structural, geotechnical, transport, water and municipal. In the planning and design field his duties may include survey, design, costing, estimating, draughting, traffic studies, and materials investigation and testing. In the field of construction duties could include: the day-to-day planning, control and supervision of civil engineering works and the selection, deployment and supervision of heavy construction plant.

COAL TECHNOLOGIST

Coal technologists are concerned with the recovery and utilisation of all forms of coal and its by-products. The coal technologist works in the following four major areas: geology, mining, coal preparation and processing, coal analysis and research.

A geologist specialising in coal technology conducts geological surveys of the extent and quality of coal deposits. The coal technologist specialising in geology provides the management with valuable information which helps it to run the mine with a high profit margin.

Technologists regularly take and analyse samples of the coal face, and report results to the mine engineer and manager. They determine the presence of methane gas as well as other explosive coal derivatives. They assist in the washing plant and in grading.

They are also concerned with product evaluation, quality control and aspects related to the use of coal in power stations. They are employed by Sasol, the petrochemical and metallurgical industry, and in the fields of domestic heating and pollution control, among others.

In addition, they conduct research to determine how this natural resource can be best utilised for the benefit of mankind. They are continually striving to improve existing techniques and methods in the coal mining industry.

COMPOSITOR

Compositors and phototypesetters operate and tend machines that provide typeset matter used to prepare printing plates for pressroom workers who print newspapers, magazines and various other publications.

Compositors read from a copy clipped to the typesetting machine and operate a keyboard. Compositors may be grouped as follows linotype compositor -- assemble letters into lines of words (slugs), monotype compositors feed perforated tape into a machine that reads and selects metal moulds for each letter; phototypesetters type the text and produce a magnetic or perforated tape. They feed the tape into a computer that hyphenates, creates columns and makes a second tape, which is photographed. The modern trend is predominantly phototypesetting.

COMPUTER PROGRAMMER

The computer programmer serves as a link between man and the computer. He writes programs, which are detailed instructions that list the steps that the computer must take to solve a problem or handle information in a logical order.

The specifications of a particular task are provided by the systems analyst. The programmer writes the program and translates it into a computer language such as COBOL, FORTRAN, APL, PL I or BASIC. He then checks the operation of the program and makes sure that the instructions are correct and that they will produce the desired information. If errors occur, the program must be changed and rechecked until the desired results are produced. Instruction sheets to feed the tasks into the computer are then prepared.

It is useful to understand programming before going into other areas of the computer industry.

COMPUTER SERVICE TECHNICIAN

Computer service technicians maintain and service computer systems and related machines such as printers and magnetic tape readers. They perform preventive and maintenance tasks such as adjusting, oiling and cleaning mechanical and electromechanical parts. They are also responsible for the upgrading of computer systems.

They further check electronic equipment for loose connections and defective components. They must determine the causes of breakdowns and repair them. Some technicians help to install new equipment. Technicians must be familiar with technical and repair manuals for each piece of equipment.

In addition, they keep accurate records of maintenance and repairs done on each machine. They fill in time and expense reports and keep inventories, order parts and in certain cases assist with training.

CONCRETE TECHNOLOGIST

A concrete technologist applies his knowledge of the properties of concrete to the task of ensuring that concrete is produced to a high standard of quality. Concrete technologists spend part of their time in the laboratory conducting tests, and part of their time on site ensuring that concrete is being produced to the correct specifications. This is a responsible position since poor-quality concrete can negatively affect the strength of a building.

CONSTRUCTION MANAGER

– see page 15

COPPERSMITH

Coppersmiths work mainly with non-ferrous metal such as copper and brass, manufacturing cylinders, pipes and cisterns.

Blueprints of the intended structure are studied and the copper plates marked off accordingly. Copper plates are bent to prescribed angles, holes are drilled and edges smoothed. The copper plates are cut either mechanically or by means of a gas cutter. The copper plates are then straightened, bent, rolled or dished to the required forms. The shaping is done with heavy machines working on the cold copper plates. Hot processing is sometimes required when difficult angles have to be shaped. Holes for rivets and stays are drilled into marked-off positions. Overlapping sides are compressed together.

DENTAL TECHNICIAN

– see page 17

DIAMOND SAWYER

Diamond cutting involves a number of stages and each stage requires a specialised tradesman to do the job.

Diamonds are first sorted by a diamond-sorter into various shapes, sizes, colours and qualities. The diamond marker than decides how the final product will look. The marker will mark the diamond for the diamond sawyer, who will saw the diamond using a copper disc spread with diamond powder and oil.

A diamond cutter then shapes the rough diamond into the so-called 'rondist'. An industrial diamond is used to cut the diamond. A crossworker then polishes eight facets on both the top and the lower sections of the diamond. Any spots or cracks are attended to. The diamond cutter then gives the final rounding.

A diamond crossworker then polishes the eight equal-sized facets on the top and lower sections of the diamond after completing the table on top and the culet below. A diamond brillianteer divides each of the top and lower facets and then polishes the triangular facets. To prevent damage from excessive friction, borax solution is used.

DIE SINKER AND ENGRAVER

The die sinker and engraver works from a picture or sketch of the item he is required to produce. He casts a mould and from this he makes a die. A die is an engraved mould used to mint coins and medals, and to do ornamental lettering and embossing. He is also able to manufacture the final product with this mould.

The die sinker and engraver engraves block, script and ornamental letters, metal and plastic labels, steel imprint blocks, and digits and letters for adding and typing machines. He engraves on moulds, plastic and metal advertising signs, metal attachments, clasps, buckles, buttons, badges, medallions, and commemorative medals. He embosses rollers for tinfoil or plastic, date stamps and plaques.

DIESEL MECHANIC

The duties of the diesel mechanic include diagnosing engine trouble, dismantling an engine when necessary, replacing or repairing defective parts and reassembling the engine. He is also responsible for repairing mechanical and electrical faults in construction machinery.

His experience often helps him to locate a problem by listening to the noise in the engine, although electronic diagnosing equipment is normally used. Sometimes a complete part has to be replaced while at other times only a minor adjustment is sufficient. If it proves impossible to repair an engine on location it is taken to the workshop where the mechanic has the use of modern tools and equipment.

The diesel mechanic also completes job cards, furnishes information on the parts that should be ordered and assists in training apprentices. Diesel mechanics who have their own businesses perform administrative and managerial tasks as well.

DOMESTIC APPLIANCE MECHANICIAN

The domestic appliance mechanician tests appliances and locates faults with the aid of various diagnostic techniques and test equipment. Appliances can vary from kettles to microwave ovens.

The mechanician adheres to basic safety measures in order to ensure safe working and a high standard of service from the appliance. This is done with the aid of electrical testing instruments and specialised tools. He sometimes has to manufacture components or attachments, using sketches and diagrams of electrical circuits and mechanical components, and he uses voltmeters, pressure gauges and temperature recorders.

Readings from these instruments are interpreted and evaluated to assist him in diagnosing the problem. After repairing the appliance, the mechanician tests it to see if it is in proper working order. He listens for excessive vibrations and makes sure the appliance does not overheat. In the case of automatic machines with programmes he lets the machine run through a programme to make sure it is in good working order. He also fills out cards and the number of hours spent on a specific job. He uses the job card to bill the client.

DRAUGHTSMAN

Draughtsmen prepare detailed drawings based on sketches and specifications made by architects, engineers or other designers.

Construction projects differ radically and specialisation in preparing drawings in the various fields is therefore necessary, for example, architectural draughtsmen draw plans for all kinds of buildings. - civil engineering draughtsmen draw plans for bridges, roads, irrigation and construction schemes. - mechanical engineering draughtsmen would sketch plans for machines and engine parts. - structural engineering draughtsmen draw designs for towers and steel frames. - town and regional planning draughtsmen draw maps and build models for projects. - and mining draughtsmen draw plans of the mines which can help with the upgrading of safety standards.

ELECTRICAL ENGINEER

Electrical engineering is a comprehensive discipline comprising electrical and electronic engineering. Electrical engineers are involved in the design, manufacturing, installation and management of various appliances and installations that generate or use electrical energy. Compare, for example, the use of solar cells and wind turbines for the generation of electrical energy.

Heavy current electricity is used for electricity supply and distribution, and subsequently for power, heating and lighting. Electrical engineering, however, is the title that covers all these aspects from power stations through digital computers to microradio communications systems.

Fields such as electronic, control, communications and computer engineering all form part of electrical engineering. The electrical (or electrotechnical) engineer makes a study of electrical supply and control systems, digital and computer systems, electronics and electrical machinery, as well as the combination of two or more of these fields in order to form a practical unit.

ELECTRICAL ENGINEERING TECHNICIAN

Electrical engineering technicians use their specialised knowledge in connection with the distribution and application of electricity. They often act as a link between the electrical engineer and the artisan.

The electrical engineering technician's duties include the designing, testing and implementation of new equipment. They may help electrical engineers to generate electrical energy, and with the task of distributing this electrical energy to the consumer. They also install new equipment at power plants and test this the equipment to see whether it functions effectively.

ELECTRICIAN: CONSTRUCTION

Construction electricians lay out, assemble, install and test electrical fixtures, apparatus, control equipment and wiring used in electrical systems. They follow blueprints, drawings, diagrams, specifications or oral instructions when performing their work.

They bend, fit and fasten conduits (pipe or tubing) inside partitions, walls or other concealed areas. Insulated cables or wires are then pulled through conduits. Wiring is then connected to circuit breakers, transformers or other components. When installation is complete, electricians test systems to be sure they are working properly.

Construction electricians must have a thorough knowledge of and follow national electrical codes as well as municipal requirements and specifications.

ELECTRICIAN:GENERAL

General electricians (sometimes known as electrical repairers) keep electrical equipment in good working order. Duties vary widely, due to the wide range of work settings. However, most of these electricians do periodic inspections of equipment to locate and repair any defects before breakdowns occur.

When trouble occurs they must find the cause and repair it quickly. Repairs may involve replacing fuses, switches or wires. Once the repair is complete they test the equipment to be sure it is working properly. General electricians sometimes install new equipment but this is usually done by construction electricians.

ELECTRONICS ENGINEER

Engineering is the application of scientific knowledge and imagination to everyday problems. Electronics engineers design systems, equipment and components that use light current electricity for application in the fields of automation, communication, navigation, data processing and entertainment.

Their services range from research into the development of components and systems to their manufacture, and the planning and setting in motion of systems in industry and in the public sector. These activities include the development of military arms and communication systems, telephone and broadcasting services, signalling systems, navigation and landing aids, instrumentation for measurement and control of industrial production processes, computer and data-processing systems and equipment for entertainment.

Modern management abilities are important. The electronics engineer must be able to participate in planning, organisation and the control of proceedings. This is especially so for those electronics engineers who work in large plants or installations such as power stations where there is a huge labour force.

The electronics engineer can specialise in the following fields: electromagnetism, energy systems, computer -engineering, bio-engineering, electrical machinery, signal assimilation, telecommunication, control systems, photonics, acoustics and microelectronics.

ENGINEERING GEOLOGIST

Engineering geologists apply their knowledge of geological principles to the planning, design, construction, operation and safety of civil engineering projects. They examine the types and geological structures of soils at construction sites to ensure that large structures such as high buildings, dams, roads or new townships are designed to suit the soil conditions or strength of the rock, so that the foundations are firm and safe and they are constructed in the most cost-effective way. They also examine the materials used in the construction of roads. Engineering geologists work very closely with civil engineers.

EXPLOSIVES TECHNOLOGIST

The explosives technologist is the person who manufactures, examines and tests commercial and military explosives. He may, for example, have the responsibility for the demolition of a building, using explosives.

The explosives technologist in the manufacturing industry is responsible for the planning of production plants, processes and analytical methods for the manufacture of explosives. He prepares a scale model of the envisaged plant, plans down to the finest detail and specifies processes.

In the laboratory routine analytical processes and development take place. Raw material is first analysed, then the technologist ensures that production goes according to plan and final products measure up to expectations. Research is done to develop new techniques, processes and products. If these are accepted, the technologist draws up specifications for their implementation.

FITTER AND TURNER

Fitters and turners are highly skilled craftsmen whose trade is essential to most industries. They manufacture, construct, assemble and fit components for machinery, vehicles, installations and other apparatus or articles. They are also responsible for their maintenance and repair.

Fitters and turners first select and mark off the material required according to exact measurements on blueprints, drawings or a model. They then shape the rough piece of metal into its final form with power-operated tools such as lathes, milling, drilling and planing machines. Finally they fit the parts to complete the machine or article required and inspect and test the final assembly for true fit.

FLIGHT ENGINEER

Flight engineers assist pilots and co-pilots on large aircraft by monitoring and operating many of the instruments and systems and watching for other aircraft. They carry out minor repairs and adjustments before take-off, while the aircraft is in flight and after landing to ensure the constant safety of the aircraft

Before take-off the flight engineer carries out safety checks against a pre-flight check list. These checks include: inspecting for fuel or oil leaks; checking for electrical, hydraulic or pressurisation system malfunctions; and verifying that passengers, freight and fuel do not exceed the weight limitations, and that the weight is evenly distributed.

While the aircraft is in flight the flight engineer needs to focus on the following tasks: monitoring fuel gauges and calculating the rate of fuel consumption; keeping a log of fuel consumption and engine performance; monitoring aircraft speed; maintaining cabin temperature; carrying out minor repairs; and taking emergency measures in the case of equipment failure, - for example, the autopilot, wing heaters and electrical and hydraulic systems. He logs repairs that were not corrected during flight and reports these to the ground crew on landing.

FLIGHT NAVIGATOR

The main responsibility of a flight navigator is to locate the position of other aircraft, ships or suitable parachute-landing spots, and to direct the course of the aeroplane. To do this he uses navigational aids such as charts, radar and sophisticated electronic equipment. Flight navigators fall into four categories: assault navigators whose primary task is to trace hostile aircraft; maritime navigators who watch over the coastline; reconnaissance navigators whose main responsibility is to locate enemy aircraft without them knowing that they are being watched; and airborne navigators who need to pin-point landing sites for parachutists.

FUEL TECHNOLOGIST

- see page 21

FURNITURE MACHINIST

The furniture machinist produces furniture components for the making of furniture. In large furniture factories about 20 different machines are used and the machinist should be able to operate them all.

The unprepared wood is sawn to the required shapes and sizes. It is then transported to the planing machine, and if the joining of wood or panels of wood is necessary, dowel pins are inserted. Details, according to design specifications, are then marked off on the wood. The next machine is then set and adjusted to obtain the required form. The wood is held firmly in place with set apparatus. Some of these tasks require special skills, whilst others are completed automatically by the machine.

GEOTECHNICIAN

The function of a geotechnician is to carry out investigations of the crust of the earth for a variety of commercial purposes. Each aspect of this challenging field is highly complex; geotechnicians therefore need to specialise in a particular area. These specialised fields in geotechnology are described below.

Mining companies employ geotechnicians to assist them in pinpointing the location of ores and also to investigate underground conditions on a regular basis to establish the existence of potentially hazardous mining conditions. Exploration geologists work with a team of scientists to locate new mineral resources for the purpose of mining or quarrying and also new water resources.

Geophysicists use sophisticated instruments to ascertain conditions in the sub-surface of the earth and also apply these techniques to finding underground water and ores and to establish bedrock conditions for large constructions. Geohydrologists apply their knowledge of geophysical techniques to locating sources of underground water and establishing the quality of this water. Engineering geologists conduct geological investigations into the subsurface of the earth to provide the constructors of large construction projects -- including dams, bridges and tunnels -- with sufficient information to design firm and safe foundations. They also need to locate building material for the construction projects.

GLASS INSTRUMENT MAKER

Glass instrument makers manufacture glass laboratory apparatus by bending, shaping, blowing, machining and melting glass components together. They work to specifications given by the scientist, usually in the form of a sketch, for whom the apparatus is being manufactured. Glass instrument makers also repair damaged apparatus.

GRAVURE MACHINE MINDER

The gravure machine minder is in charge of printing machines. The printing cylinders needed by gravure machine minders are prepared by photogravure engravers.

The gravure machine minder cleans the inking system and oils the machine. He locks the printing cylinder into position on the machine, fills the ink trough and regulates the flow of ink. He also threads the paper through the machine guides and rollers, and adjusts the rollers and paper-folding and cutting mechanisms. Before printing he sets and adjusts the scraper blade to remove excessive ink from the surface of the cylinder. He then makes a trial run and checks the legibility and the uniformity of the printing. When everything is in order, he restarts the machine and brings it to full speed to commence printing. He ensures that printing, folding and cutting are proceeding correctly.

INDUSTRIAL ENGINEER

The industrial engineer or production engineer utilises knowledge and skills in the areas of mathematics, statistics and the physical, social and economic sciences, coupled with engineering analyses and designs.

His function entails the following: - investigations to improve work methods with regard to mechanisation and automation; -development of labour standards and manpower utilisation systems; -profit studies and investigations into alternative capital expenditure; -medium- and long-term planning with regard to all aspects of production. To carry out all these tasks the engineer will first define the problem, plan an investigation, process information and finally implement his plan.

INDUSTRIAL ENGINEERING TECHNICIAN

Industrial engineering technicians are directly or indirectly concerned with the production of articles or objects through the optimal utilisation of capital, manpower and raw materials. Their main aim is to ensure that the highest possible profit margin is reached.

The term 'production technician' denotes many different occupations. These may involve many different areas of manufacturing, each of which may be attached to research, or design and development, or construction and installation, or industrial supervision and maintenance, or marketing, sales or management. The metallurgical production technician could specialise in different aspects of metallurgical engineering, e.g. production of metal from raw material (iron from iron ore); refining (iron to steel); milling (rolling ingots into finished or semi-finished products); or maintenance of machinery.

INDUSTRIAL TECHNICIAN - HYDROMETRY

The primary responsibility of an industrial technician in hydrometry is to support and assist the engineer and hydrologist. The work in this field can be divided into two basic areas: the planning and design of various water- storage, and -transportation and pumping systems, and the construction and maintenance of these systems.

The duties that an industrial technician in hydrometry can be expected to perform on the planning side include: surveying sites for proposed new dams, canals, tunnels pipelines and water-pumping plants; preparing and surveying sites for flood calculations; and assisting engineers and hydrologists in the design of water-storage and transportation systems. Duties on the construction and maintenance side include: advising irrigation boards, municipalities and farmers on irrigation matters; supervising construction work; and frequent checking on existing structures, systems and instrumentation to establish whether repair work or improvement is required.

INSTALLATION ELECTRICIAN

An installation electrician plans the layout of, and installs and repairs, electrical wiring in domestic residences, offices and factories. He ensures that wiring is not unsightly, unreliable or hazardous and that it complies with the safety standards laid down by the SABS Code of Practice for the Wiring of

Premises and the Occupational Health and Safety Act of 1993.

The installation electrician works in a team, as well as indoors and outdoors. He must take all the necessary safety precautions because the work is very dangerous.

INSTRUMENT MECHANICIAN

Instrument mechanicians play a vital role in ensuring that automatic processes and plant systems operate correctly and efficiently.

They are responsible for measuring the pressure, temperature, position, level, mass and flow of solids, fluids and gases. To do this they use a series of field and control instruments that ensure that plant processes operate according to specifications. Should fluctuations occur they diagnose the faults and repair them as speedily as possible.

Regardless of their field, instrument mechanicians are trained to manufacture and repair almost any kind of instrument, whether electrical, mechanical, hydraulic, chemical or optical. To design a specific research instrument they work according to sketches and instructions from scientists and engineers.

JEWELLER / GOLDSMITH

see page 9

JOINER AND WOOD MACHINIST

The joiner and wood machinist is responsible for manufacturing and assembling the woodwork in a building, such as the doors, door frames, window frames and built-in cupboards. He or she works with both hand and machine tools, and also spends his time making ornaments.

LAND SURVEYOR

Land surveying is the science and practice of recording and setting out the exact measurements of man-made and natural features of the earth's surface. Surveying is basic to all construction planning, and development and involves the making of maps and the determination of boundaries. Surveyors participate in the planning and construction of roads, railways, power lines, canals, engineering structures, buildings and townships, and are indispensable when it comes to preparing data on the measurements of lakes, rivers and the coastline.

The land surveyor can specialise in one of the following fields: geodetic surveying (determining markers or beacons according to the lines of latitude and longitude), cartography (the drawing of maps), cadastral surveying (this entails the measuring of property for the planning of towns and cities), engineering surveying (helping with the design of roads, bridges and tunnels) and hydrographic oceanographic surveying (surveying the marine environment for the development of harbours).

LETTERPRESS / LITHOGRAPHIC MACHINE MINDER

Press operators are designated according to the type of press they operate: letterpress, gravure or offset. Letterpress machine minders operate and are responsible for the maintenance of letterpress printing machines. Letterpress machine minders undertake printing done on 'flat bed' letterpress printing machines.

They receive special printing frames (called 'chases') containing the typesetting and blocks from the compositor and lock them securely into position on the bed of the printing machine. They attach 'make-ready' or 'overlay' tympan sheets to cylinders, against which the printing paper rests. They study trial impressions and adjust the machine where necessary. They adjust the flow of ink during the printing process, ensure that the paper is fed in properly and that printing of a high standard is maintained. They oil, maintain and effect minor repairs to the machines and machine tools.

Many modern plants have installed printing processes that use computers and sophisticated instrumentation to control press operations. With this equipment, the letterpress machine minder monitors a control panel that detects problems. To adjust the press he pushes the appropriate button on the control panel.

LIFT MECHANIC

The lift mechanic is involved mainly with the construction, erection, testing and maintenance of lifts, escalators and hoists, in accordance with regulations as decreed by legislation.

Lift mechanics work as part of the crew that installs and repairs elevators, escalators and similar equipment. When new elevator is installed, the shaft is constructed and prepared for use. The electrical wiring and controls are then installed. The elevator car is then assembled and finally the hoist that winds and unwinds the cable is installed.

When the elevator is operational mechanics check, adjust and recheck it to be sure it is working properly. Once equipment has been installed, lift mechanics maintain and repair it. They may also replace old equipment with newer models.

LITHOGRAPHER

Lithographers perform a wide range of duties, such as setting up the printing machine, including - setting rollers, cylinders, ink-flow, dampers and ensuring the smooth transport of printing material.

Specialised fields include the following: photo-lithographers (camera operators) photograph and develop negatives of the materials to be printed; lithographic artists retouch negatives to lighten or darken certain areas; strippers arrange and paste negatives onto layout sheets; platemakers place sheet of film on the prepared metal plate and expose both to bright lights, and then treat the plate with chemicals to bring out the image to be printed; press operators mount the developed plate on the off-set press and monitor the printing process while operating the press; metal decorators operate an off-set press that prints on metal.

LOCKSMITH

Locksmiths install, repair, change and open locks and combination locking mechanisms. They also make keys and duplicate them.

In emergencies, e.g. when customers are locked out of cars, homes or offices, locksmiths can pick the locks, to retrieve keys left inside, or make duplicate keys by impression or key code if the keys have been lost. Combination locks are opened by touch or by use of a drill. Locksmiths repair damaged locks by replacing tumblers, springs and other parts.

Locksmiths also recommend security measures such as periodical re-keying (changing the locking mechanism to fit new key codes) for businesses. Some locksmiths, known as protective signal repairers, install and repair burglar and fire alarm systems. Most locksmiths work irregular hours because they are on 24-hour emergency call. They therefore need to have equipment with them at all times.

MECHANICAL ENGINEER

The mechanical engineer is involved with the design, development, production, marketing, installation, maintenance and general research of machinery and mechanical equipment in almost every type of industry and technology.

The mechanical engineer usually specialises in one of the following fields: transportation: work on aeronautical, marine and automotive engineering equipment, turbines and engines; power generation machinery such as steam, water and gas turbines used for driving power generators; agriculture machinery such as special tractors, harvesters, crop collectors, packing machines; mining pumping plants, ventilation fans, conveyor belts, drilling machines; industry manufacturing machinery; environmental engineering creating the essential artificial environment man needs in order to work comfortably (ergonomics); biomedical engineering developing machines and devices such as the heart-lung machine, the iron lung, the artificial kidney machine, and realistic artificial limbs and organs such as heart valves.

MECHANICAL ENGINEERING TECHNICIAN

Mechanical engineering technicians fill the gap between the tasks performed by engineers and those performed by artisans.

The machines that they develop range from moving machinery to mechanical appliances. A few examples of these types of machinery are ships, railways, aircrafts, air-conditioning units and automobiles. Mechanical engineering technicians assist engineers in design and development by making sketches and rough layouts of proposed machinery and other equipment. The cost and practical value of designs is then analysed.

When planning and testing the performance of experimental equipment, technicians record data, plot graphs, analyse results and write reports. They may sometimes recommend design changes. Technicians help to prepare the layouts and drawings of the assembly process and parts to be manufactured. They may test and inspect machines and equipment.

In addition, they may help engineers to solve production problems. Some mechanical engineering technicians work in technical sales. The tasks of mechanical engineering technicians are more or less evenly divided between intellectual work and manual work.

METALLURGICAL ENGINEERING TECHNICIAN

The metallurgical technician bridges the gap between the professional metallurgist and the artisan. His training enables him both to communicate with the graduate on a technical and theoretical level, and guide the artisan on a practical level.

These technicians assist professional metallurgists in the search for metals and alloys with improved, desired properties. They also assist them to find the most economic and practical ways of extracting metals from ores. They do this by studying and testing the structure and properties of metals to determine such things as grain structure, soundness, consistency and the physical properties and chemical content of various metal objects.

They may supervise production work in foundries and other industries where metals are re-melted for re-use. They also test the accuracy of instruments, calculate necessary changes and must be sure that the finished work meets the quality standards. The work of the metallurgical technician is visible in a wide range of products. Metals are used in the construction of aeroplanes, chemical plants and cars.

METEOROLOGICAL INSTRUMENT TECHNICIAN

Meteorological instrument technicians are responsible for developing, installing and maintaining the sophisticated computer systems, radar, automatic weather stations and electronic airport systems that meteorological technicians use in gathering information for their weather forecasts. They need to liaise frequently with the meteorological technicians and the two should, ideally, work as a team with the same goal – which is to gather a high standard of information in order to achieve weather forecasts that are as accurate as possible.

METEOROLOGICAL TECHNICIAN

Man's health, security, food production, ability to work and transport systems are all dependent on the weather. Meteorological technicians play a vital role in meteorological services. They collect meteorological information with the aid of computers, radar and automatic weather stations. After checking this information they supply short-, medium- and long-range weather forecasts to aviation, shipping and the public via radio and television broadcasts and the newspapers. They also forward the information to the most important weather stations using meteorological codes.

Meteorological technicians are responsible for the maintenance of the instrumentation that they use to aid them in making observations. Practically all meteorological services are supplied by technicians.

MILLER

The miller is responsible for the processing of different types of grain, particularly wheat and maize. The wheat milling process consists of three stages, each with its specific type of machinery. The breaking, scraping and reduction processes take place during these stages. The process of maize milling is much the same as that of wheat, but not as many production stages are required. To ensure that the correct standard and quality is maintained, millers are required to test their products.

In addition the miller supervises the work of mill workers. Today the milling process is highly mechanised. The task of the miller consists chiefly of setting milling machines and supervising their operation. It is important that millers obey all the relevant health regulations. This will ensure a food product of the highest quality.

MILLWRIGHT ELECTROMECHANICIAN

This trade covers mainly mechanical and electrical maintenance work. Tasks include dismantling, fault-finding, repairing and in some cases manufacturing parts, as well as the maintenance, reconstruction and installation of machinery.

With modern developments towards automation, this trade also requires a knowledge of electronics as applied in the control of heavy electrically driven equipment. The artisans must also have a thorough knowledge of the manufacturing of machine components. Although fault-finding is one of their major responsibilities, they are mainly concerned with the installation of new machinery. This requires specialised knowledge in fitting.

Electrical installation is another aspect. The artisan dismantles electric motors, tests them, checks their wiring and determines their power output and consumption. Automation also requires skills in electronics as these skills are used in controlling heavy, electrically powered equipment.

MINE SURVEYOR

Mining surveyors are responsible for determining the direction of all the underground workings of a mine. They have to plot these and keep them regularly updated, so that surface officials and management can pinpoint any spot underground at any given time. Mining surveyors are also responsible for measuring the areas and volumes blasted by the underground crew. Taking ore samples to establish which areas are the most profitable to mine is also part of their duties. Mine surveyors do their practical work underground in the mornings and spend the afternoons on the surface, assimilating their findings and doing the necessary calculations.

MINING ENGINEER

Mining engineers are both mining experts and engineers. They plan, design, construct, operate and manage the facilities that are used to get solid materials out of the earth. These engineers must have a background in geology and in civil, mechanical and electrical engineering since they must be prepared to supervise any phase of mining.

They are responsible for the economical and efficient operation of mines and for mining safety. They may work with geological and metallurgical engineers to locate and appraise new ore deposits. Others may develop new equipment or processes for mining. Mining engineers may also work on problems related to protecting the environment.

It is important to note that, although most of the mining engineer's time is spend in the office, he also works on the site to see whether the instructions are followed as planned.

MODEL BUILDER (ARCHITECTURE)

Model builders (architecture) build scale models of buildings drafted by architects. They construct different types of models to depict particular features of the building. These include block models to show only the external form of the building; works models to represent the plans in concrete form to builders; detailed completed models to show what the actual building will look like; interior models showing the internal set-up complete with scale-model furniture. In this case the roof of the model may lift off, to show the inside arrangement. Scale models of buildings are necessary to obtain practical information as to how the building will look when finished, how much sunlight will fall through the windows and how the building fits in with its surroundings.

Models are useful because they can help the architect and his client to decide whether the proposed building should be constructed or not. Developers also make use of models to illustrate precisely how the proposed building will look. This enable them to sell the buildings before the project has even started.

MODEL BUILDER (TV)

Model builders (TV) are responsible for visual effects, especially those used in children's programmes screened on television or presented on stage. They also make specialised props and create unique effects which are utilised extensively in variety and drama productions.

The model techniques department has a specialised models and effects section that develops and constructs electronic controls and innovations; a puppet effects section which produces marionettes, and hand-, rod-, and electronic controlled puppets, and a specialised property section which makes puppet production sets, minute accessories and scenic models such as rural scenes with lakes, rivers, trees or urban scenes.

The model builder works in his own workshop. He is also in close contact with all the departments involved in the production of a television show or play.

MOTOR CYCLE AND SCOOTER MECHANIC

Motor cycles and scooters need periodic servicing to operate at peak efficiency. This routine servicing of motor cycles and scooters represents a major part of the mechanic's work.

These artisans also repair and overhaul motor cycles, scooters and similar vehicles and assemble new ones. They determine the nature and extent of malfunctions. They connect a test panel to engines and measure and adjust generator output, ignition timing, etc. They dismantle the engines and repair or replace defective parts. They remove cylinder heads, grind valves and scrape off carbon. At times, unobtainable parts must be manufactured.

They replace worn valves, pistons and cylinders and put back and test repaired engines. They repair and adjust clutches, brakes and drive chains. They also repair or replace headlights, starters, mufflers and various other parts. They hammer out dents in frames, weld tears, put in spokes and align wheels.

MOTOR MECHANIC

Old and new cars sometimes experience problems in starting or functioning well mechanically. It is the task of the motor mechanic to find, examine and repair breakdowns and damages.

After determining the cause of the problem motor mechanics prepare a quotation for cost of repairs (in small shops), or have other workers perform this duty (in larger shops or dealerships).

Their tasks include: taking out broken or damaged parts of vehicles, ordering new parts, repairing or replacing broken or damaged parts, putting the vehicle back together in good working condition, adjusting brakes, tightening body bolts, aligning wheels, and performing routine services to prevent problems.

MOULDER

Moulders cast molten metal into moulds to produce solidified castings. They first prepare and shape the sand in which the mould is to be formed. They then prepare the core or inside of the casting by means of a core box before they place the pattern into the moulding box and pack sand firmly around the pattern to impress its form in the sand. The top faces are covered by moulding boxes. Heavy castings are formed by holes being dug in the ground and lined with sand or brickwork. The pattern is then removed and the mould dusted with plumbago. When dry, molten metal is poured through runners into the mould. After the cast metal has cooled down, the mould is broken away and the edges of the solidified casting are smoothed, before it is finally machined.

NAVIGATING OFFICER (NAVY)

The main responsibility of a navigating officer is to determine the ship's position by means of the sun, moon, stars, landmarks, magnetic compasses and radar, and to keep the ship on course by continually referring to these landmarks and equipment. The captain, chief officer and third officer are all navigating officers and they take turns to keep watch at sea from the bridge. The navigating officer's skills are particularly necessary in situations such as passing through narrow waterways and entering and leaving harbours. He is also responsible for the ship's refuelling and ensuring that the ship's navigational equipment is correctly maintained and used.

OPTICAL TECHNICIAN

Optical technicians prepare glasses prescribed by optometrists or ophthalmologists. They study the prescription carefully to decide on the raw materials to be used, and the processes to be followed. Optical technicians (surfacers) select the right kind of lens blanks and polish them according to the prescriptions. Finishers measure, mark and cut lenses to fit the frames, finish lenses and mount them in the frames. Optical technicians also repair damaged glasses and frames and prepare contact lenses. The surfacing, setting of curves, smoothing and polishing, shaping of lenses, glazing of lenses and the final checking can all be done automatically

ORTHOTIST-PROSTHETIST

see page 18

PAINT TECHNOLOGIST

see page 3

PAINTER AND DECORATOR

Painters and decorators paint, varnish or stain the indoor or outdoor walls of buildings.

They measure surfaces to be treated and determine quantities of the materials needed before preparing the surfaces by sanding, scraping or burning away old coverings. Sometimes special chemicals need to be used. Nail holes, cracks or other problem areas are filled in with plaster, putty or other compounds.

When new surfaces are painted, a primer or sealer coat may first be applied. Painters and decorators mix paints and match colours. They may use rollers or spray guns rather than brushes as these tools allow paint to dry more quickly. Painters and decorators put up scaffolding or swinging chairs when working on tall buildings or other structures.

PANEL-BEATER AUTOMOTIVE BODY REPAIRER

Panel-beaters repair and finish the damaged bodies of vehicles. The damaged parts are first aligned, then beaten into shape and finally filed for smoothness. Parts that cannot be reached from the outside are reshaped using special techniques. Dents that cannot be taken out are filled up with a body filler or lead, and smoothed. Panels that have been stretched are heated and then hammered in a special way which has a shrinking effect on the metal. Irreparable parts are replaced with new ones, or with used parts from scrapyards. Panel- beaters are also responsible for the final assembly and inspection for correct fit, as well as for all the fastening components.

The work of the panel-beater is very demanding because he is expected to continuously hammer the damaged parts of a motor vehicle. In bigger workshops the panel-beater works closely with tradesman such as the spray-painter, automotive trimmer, automotive machinist, automotive sheet metal worker and motor mechanic.

PAPER TECHNOLOGIST

A paper technologist is responsible for controlling the processes involved in the conversion of the raw material,- namely wood,- into paper, cardboard and related products. These processes include the manufacture of pulp from the raw materials, supplying the chemicals for the various processes, the design, manufacture and operation of the paper machines, paper and board making, converting and coating, research and development, and project management. Paper technologists apply their knowledge of chemical and mechanical engineering and paper factory technology to these processes to ensure high standards of quality in the final product. South Africa is a world leader in paper-manufacturing technology and research.

PATTERN-MAKER

The work of the pattern-maker entails the manufacture of durable patterns from materials such as wood, plastic, fibreglass or metal. These patterns are the starting point for a chain of activities leading to the manufacture of castings for products such as pumps and bearings.

The pattern-maker works from drawings. After the material has been selected and marked to size it is cut or sawed, finished off and assembled into the pattern or model which is used by the moulder to form moulds for castings.

PETROLEUM TECHNOLOGIST

Petroleum technologists assist in the exploration of and drilling for oil and gas. They make an important contribution to the manufacture of fuel, lubricants and other petroleum products.

During exploration they do research on different types of mud used to lubricate bore tips. They also keep daily records of drilling progress. The primary function of a petroleum laboratory technologist is quality control in a refinery or a lubricant manufacturing plant, or in the field of petroleum product application and use. These products are those obtained from crude oil by refining processes and include liquid petroleum and gas, as well as aviation, motor, diesel and furnace fuels, keroseines, solvents, lubricating oils, greases, waxes, bitumen and special products.

PHOTOGRAVURE ENGRAVER

A photogravure engraver is responsible for the reproduction of all material on a copper plate which is used in the gravure printing process. He uses cameras and screens to photograph the material (this may include photographs, text that has been set, line drawings, etc.) to be reproduced. He develops a negative and then a positive on a transparent, light-sensitive celluloid or plastic material, which is placed beneath pigmented paper in a frame. The pigmented paper is finally transposed on to a slowly rotating copper cylinder in a trough containing hot water, to develop the image or picture. A photogravure engraver may also develop colour photographs by using three separate colour filters.

PHOTOLITHOGRAPHER ELECTRONIC ORIGINATOR

Photolithographers are responsible for all the photographic work related to the lithographic printing process. The technological developments in the printing industry have taken place at a rapid pace and most of the work is now done by computer. Part of the work done by the photolithographer is often done by desk-top publishing.

Most of the work that photolithographers do is done before the printing takes place. They first arrange the photographic film in the processing camera. A knowledge of the factors that could influence the negative of the material to be printed such as the set copy, line drawings and similar material, is necessary. They develop the film either manually in a darkroom, or by means of a machine, to produce negatives or positives, which are used to imprint the lithographic plates that are used on the printing press. They reproduce colour photographs by means of four negatives (or positives) which are developed separately and transposed onto metal plates. When all of these plates have been printed, the result is a four-colour (known as full-colour) picture. They also operate photo-composition machines.

PLASTERER

The plasterer's work generally entails protecting, strengthening, covering and decorating brickwork and concrete by plastering the surface. This includes tasks such as the completion of concrete ceilings and the making and fixing of plaster-board ceilings.

Plasterers not only apply but also prepare the coatings. Sometimes they also lay the finishing surfaces for cement floors. Plasterers may cut and fix tiles in sequence to a plastered dry, wet wall. Some plasterers do complex decorative and ornamental work using moulds or designs.

PLASTICS AND FIBREGLASS WORKER

Sectional buildings, bathroom units, tanks, pipes, canopies and bodies for vehicles and swimming pools are manufactured by plastics and fibreglass workers. Most of these products are made of fibreglass because it offers a high resistance to rust and corrosion

Plastics and fibreglass workers manufacture forms, models or moulds
They treat the form or mould with a releasing agent to prevent the product from sticking
With a brush or spray-gun they apply successive layers of polyester resin until the required thickness is obtained and they allow the product to dry and cure
They then release the product from the mould and sandpaper, wash and polish it where necessary. They also manufacture and fit wooden and metal beams for reinforcing cabs, cabins, etc., for pleasure craft and boats.

The plastics and fibreglass worker must take special care to protect himself from the fibreglass and resin which are difficult to remove from skin and clothing. They must wear gloves, aprons and facemasks at all times. The facemasks also protect their lungs from the fibreglass particles, which can be damaging.

PLASTICS TECHNOLOGIST

Plastics technologists do highly skilled work in the plastics industry, which is linked to the chemical industry. Initially coal, natural gas and oil are processed to yield chemicals. Inorganic components such as salt, water and air are also used in the preparation of the raw materials. This is only the starting point in the manufacture of plastics.

Various techniques and processes are used to produce the different types of plastics known. Technologists, sometimes called polymer scientists, test these processes and put them into operation. They oversee these processes and the production of plastics, and test the quality of the plastics and the ultimate consumer product. They locate and correct factory faults.

The plastics technologist is not only responsible for the development and testing of plastic products, but may also participate in the marketing, production, sales, services and management activities.

PLUMBER

Plumbers install water, gas and waste-disposal systems in homes, factories and other buildings.

When installing new systems or modernising old ones, plumbers take measurements and make drawings to show where the pipes will connect with outside lines and where fixtures will be placed. They then measure, bend, cut and thread pipes according to the drawings. Pipes are joined by bolting, blazing, gluing, screwing or soldering them together.

They also repair weathered and leaky roofs. When doing repair or maintenance work, plumbers must locate the cause of the problem and replace broken or worn-out valves, and clear pipes and taps. Qualified plumbers may own their own businesses and employ and supervise other plumbers.

PRINTERS' MECHANIC

Most large printing concerns are equipped with modern engineering machinery such as lathes, grinders, milling machines, etc. A career in this field offers tremendous scope and includes the maintenance and rebuilding of all classes of printing machinery.

Printers mechanics mount, re-install, maintain and repair a wide variety of machines and equipment that is used in the printing industry. They assemble, install and test a new machine, or part of a machine so as to integrate its operation with that of the already existing machines.

It is important that the work done by the printers' mechanic be completed in as short a time as possible because downtime on a printing machine can lead to huge production losses. The printers' mechanic also needs to be extremely cautious because negligence can lead to injuries.

PRINTERS' WAREHOUSING (INCLUDING CUTTING) WORKER

Before the actual printing of books, newspapers, periodicals and other printed matter takes place, the paper must be prepared and submitted in the appropriate forms and sizes. Printers' warehousing (including cutting) workers measure and cut the paper according to specified dimensions.

For cutting they operate power-driven guillotines. The paper is then arranged in batches and prepared for the subsequent printing operation. These workers must therefore be well acquainted with receiving and despatching procedures.

PROCESS ENGRAVER

Process engravers prepare all types of illustrations that cannot be typeset. They operate process cameras and produce negatives of photographs and other artwork. These negatives are developed to make light impressions (exposures) on metal plates that are highly sensitive to light. Sections of the plates that have been exposed to light become resistant to acid. When the plate is immersed in a nitric acid bath, the acid etches away the unexposed sections of the plate and reveals the sections in full relief. As soon as a print is ready, it is ruled according to size and mounted on wood. The blocks are then mounted and composed in page form.

QUANTITY SURVEYOR

A quantity surveyor is a highly qualified member of a profession that plays an indispensable role in the building, construction and allied industries, including mining. His work involves the control of the financial aspects of the planning, design and construction of buildings.

The quantity surveyor is also described as a 'building economist'. He acts mainly in the area of cost (particularly cost to the client) and is a member of a professional team which may include architects, engineers, and electrical and mechanical engineers, all of whom are appointed to advise their client on various aspects of a particular building project.

RADIO AND TELEVISION MECHANIC

The most important tasks of radio and television mechanics are fault- finding and effecting repairs to radio and TV sets, as well as to other devices. These devices may be defective for various reasons, for example parts that have become worn, faulty parts, and bad connections as a result of heat and dampness. These mechanics find the source of the problem by checking tubes, observing the picture and sound, and looking for broken connections. Mechanics may make simple adjustments in customers' homes or use wiring diagrams and special testing equipment to find and fix more complex problems.

Mechanics may set up, install and adjust TV antennas and receivers and instruct customers in the proper use of this equipment. These mechanics also install and repair components in stereo systems, video-tape machines, car radios and public address systems.

Most of the radio and television mechanic's work is done indoors in a workshop, but it is also expected from him to do extensive travelling to clients' homes.

REFRIGERATION MECHANIC

The industrial refrigeration mechanic installs, repairs and maintains the air-conditioning and refrigeration equipment used in a wide range of applications. This involves reading and understanding mechanical, electrical and architectural drawings and the use of hand and workshop tools, brazing and soldering equipment and measuring instruments. The artisan installs the unit and makes the necessary electrical connections. A good knowledge of electrical principles is essential. The refrigeration mechanic also undertakes the maintenance and repair of units. In doing this he must be able to trace a fault and make repairs and adjustments. These faults may be electrical or mechanical.

RIGGER

Riggers erect hoisting tackle, assemble and erect derricks or sheer legs for construction purposes and install and maintain steel cables and ropes. They assist in erecting chimney stacks, large buildings, heavy machinery, etc.

Before objects are handled, riggers calculate their weight and ascertain the best way of securing and moving them. They are responsible for the inspection, lubrication and maintenance of all types of lifting tackle, including cranes, derricks, driving winders, jacks, hoists and manually operated lifting equipment. They usually have a good knowledge of scaffolding, platforms and tripods. They do ground work such as clearing up tracks after a railway accident, or installing or moving heavy machinery. Riggers play an important role in all branches of heavy industry.

ROLL TURNER

The trade name of 'roll turner' is descriptive of the work by means of which a metal blank is formed (turned) to a specific shape required for the rolling of steel in a rolling mill. Railway rails are one of the products roll turners make.

At rolling mills metals are shaped by passing heated metal blocks or 'ingots' back and forth between the specially formed rolls of a mill stand, until the desired shape and length have been obtained. The roll turner forms and shapes these sets of rolls by means of a lathe and specially prepared tools such as templates (patterns) until they conform to the specified shape. Working from a blueprint the roll turner clamps a steel block in a giant lathe and cuts the desired grooves into the steel block, using cutting tools. The roll turner constantly checks the shape and size of the grooves on the roll against a template (pattern). In this way he manufactures the rolls to be used in rolling mills to shape other steel blocks.

ROOFERS

Roofers are specialist building workers. They use their special skills to erect roof structures. They also apply water proofing and install rainwater equipment and flashings.

Research and development has resulted in an increase in the types of materials the roofer has to install. Some workers work with traditional materials. Other roofers work with very sophisticated waterproofing systems.

The renovation of buildings is a common practice today and requires the special skills of a roofer. Roofers work closely with carpenters, bricklayers, plasterers and other tradesmen in the building industry.

ROTARY MACHINE MINDER

These artisans properly fasten the cylindrical surfaces, which do the printing, in their fixed positions, after which they set the rotary machine in motion. They ensure that stereotypes or lithographic metal plates fit properly and contact the paper evenly. They place the huge paper rolls into the rotary machine, set the ink rollers, fill the ink holders and make proofs to ensure that all letters and images print properly onto the paper. They examine proofs and adjust the machine and the ink until the printing is done properly. They test the colour and ink quantities and check the machine at regular intervals throughout the printing process to ensure accuracy and quality printing.

RUBBER TECHNOLOGIST

The rubber technologist applies his knowledge of physics, chemistry and engineering to the process of converting raw rubber material into saleable products like tyres and elastic bands.

Rubber technologists usually specialise in specific areas of the rubber industry, namely drawing up standard formulas for the production of rubber products based on on-going laboratory experimentation, designing new rubber products, controlling the rubber manufacturing process and ensuring that quality standards are maintained throughout, and marketing and sales of rubber products.

SAILMAKER AND UPHOLSTERER

Sailmakers and upholsterers use canvas and PVC sheets to make or repair a variety of articles like tool bags, blinds, camping beds, tents, army webbing, sails, tarpaulins, garden chairs and sunvisors.

Sailmakers cut canvas and PVC sheets according to the patterns and stack them. They stitch the various pieces together by hand or machine and add the necessary accessories, like PVC windows, eyelets, ropes, zips, press studs and buckles for fastening.

Sailmakers also manufacture or repair large items like tents, sails and tarpaulins. When articles are made with PVC sheetings only modern apparatus is used to fuse the seams together. These artisans also cut and stitch material lining or stiffening into certain articles.

SCALE FITTER

Scale fitters repair and recondition the various working parts of lever systems and fit replacement parts. They assemble, set up, test and adjust the various types of beam, counter and platform scales. These include the Robersval and Beranger level systems fitted with semi- or self-indicating mechanisms. They unpack, erect, set up and adjust self-indicating and partially self-indicating scales.

They are also trained to erect, maintain and recondition road and rail mass bridges fitted with self-indicating and non-self-indicating mechanisms. Parts of scales which cannot be repaired or replaced may be made by scale fitters. The measuring of weights, whether of foodstuffs or any other product that is sold according to weight, must be accurate. The authorities act strictly against those who do not abide by the regulations. The scale fitter must see to it that the regulations are not violated.

SCIENTIFIC GLASS BLOWER

The scientific glass blower manufactures glass instruments and apparatus for use both in laboratories and in fieldwork by scientists and engineers in their research, development and tutorial duties.

The glassblower also works in industry, particularly in the pharmaceutical and chemical industries. The scientific glass blower is often required to assist in the design of prototype equipment and thus plays a major role in the success or failure of a project.

His work entails the shaping and forming of a variety of types and shapes of glass according to specifications given. The glass can be machined, ground, drilled, blown, bent, fused (welded), twisted, drawn and parted.

SHEETMETAL WORKER

Sheetmetal workers manufacture various types of articles and components out of sheet metal less than three millimetres thick, mainly for the construction and engineering industries. These artisans make and install sheet metal ducts for air-conditioning, heating and ventilation systems. They make and install flat metal for kitchen walls and counters and stamped metal for roofing and siding. They also install roof gutters and down pipes for rainwater drainage and make skylights and vents for industrial buildings.

They manufacture most metal components at the shop. They measure, cut, bend, shape and join most of the pieces they will use. After the metal has been cut they cement, bolt, rivet, solder or weld the seams and joints together to form ducts, pipes, tubes and other items. In the final stage, the excess soldering or welding is removed and the article cleaned. Sometimes a product has to be treated against rust by galvanising, tinplating or treatment with certain chemicals. Workers install these by hanging or securing them to ceilings or walls.

SHOPFITTER

Shopfitters make, assemble and fit display boards, showcases, counters, shelves and cupboards in shops or businesses.

They interpret architects' drawings for exact specifications and order the required quantities and types of material; they shape the wood and fittings with power tools in a machine shop, or hand tools at the workbench; they build, assemble and fit these components into the required positions in the store; they paint, stain or polish the finished articles and add the necessary trimmings; they manufacture metal fittings like grilles, banisters and hand rails in a metal shop and fit these; and they do minor repairs and fittings.

SIGNWRITER

Signwriters do the lettering for various signs on windows, building contractor signboards, walls of buildings, and trucks, etc.

They prepare rough sketches from specifications and plan the lettering. They measure the surface on which the lettering is to be done and mark the height and position of the letters in chalk to ensure correct spacing. They then paint the sign, spreading the paint evenly and making good outlines. A second coat of paint is usually required when the first is dry. Signwriters are frequently called upon to do gold signs on shop windows. Different techniques are used to paint on glass. Gold leaf is applied for gold lettering, which is usually backed with paint. Signwriters also paint logos and simple illustrations.

SPRAY-PAINTER

These artisans use spray guns to spray paint onto the body work of a vehicle to change its colour or to repaint scratched or damaged paint work. They prepare the body work by removing dirt or grease, or smoothing panelbeater parts, and remove paint already on the section, with sandpaper or paint-removing chemicals. They cover the rest of the body work with paper in order to protect it. A preliminary coating of primer is applied and this is followed by a thin layer of primer filler. Spray-painters mix and match paints until exactly the same shade as the rest of the vehicle is obtained before the final four or five coatings of the required colour are applied. Paint has to be applied evenly and each coating allowed to dry thoroughly.

STEREOTYPER

Stereotypers manufacture the surfaces (stereos) which are fixed to printing machines to do the printing. Stereotypers receive the set type in steel frames or (forms) from the compositor and manufacture stereo plates for the printing machines. The type form is pressed into a moist substance, called 'flog', which hardens after the impression is secured and the moisture extracted. This negative impressions is placed in a casting box and molten metal poured on it under slight pressure. It is then rapidly cooled and trimmed. A number of plates or casts are manufactured from one mould or matrix. After passing through the final stages of production the stereotypes are sent to the rotary machine minder who fixes them to the printing machine. Stereotyping is a designated trade but prospective candidates who find employment with an employer providing apprenticeship training may still register as apprentices.

STONEMASON

Stonemasons work predominantly with two types of stone – natural cut such as marble, granite and limestone, and artificial stone made from cement, marble chips or other masonry material. Stonemasons cut, shape and clean these stones to build and repair stone structures such as piers, walls and abutments. They also lay pavements and paths, kerbstones and special types of masonry for vats, tanks and floors. They may work from drawings in which each stone has been marked for placement.

SYSTEMS ANALYST

– see page 24

TELECOMMUNICATIONS MECHANIC / ELECTRICIAN OR TECHNICIAN

Telecommunications mechanics or technicians are responsible for the maintenance and repair of underground and aerial telecommunications lines, mechanical aids, power installations, satellite earth stations, radio stations, and telegraph offices.

They manufacture and repair equipment and parts in workshops where the cabling, wiring and assembling of equipment are done. Mechanics or technicians are supported by telecommunications assistants or technical personnel.

Their duties may include the following: telephony (the installation and maintenance of computer controlled equipment), transmission (the installation and maintenance of telephone lines), telegraphy (installation and maintenance of telegraphic equipment), field equipment (the installation and maintenance of underground and above-ground telephone lines), mechanical or electrical (the repair and maintenance of equipment in workshops) and the application of existing technology (design of new advance equipment like the Disa telephone).

TEXTILE TECHNOLOGIST

Textile technologists have been trained to have a good overall knowledge of textile technology, of the manufacture and processing of all types of textiles and their properties. Many have specialised knowledge of a particular field, such as spinning, weaving, knitting, dyeing, testing or quality control.

In industry the textile technologist may be engaged in the quality control of products or processes, or he may be involved in supervising the production of textiles at various levels of management requiring his particular skills. As a manager the textile technologists will be concerned, in addition to production problems, with organisational and personnel problems associated with the running of a factory.

He may also assist with technical advice in organisations concerned with the supply of many products used by the textile industry or assist in technical sales advising customers on the best use of suitable products. They also conduct research to develop new or improved materials while laboratory technologists analyses the structure and components of the material.

THEATRE TECHNICIAN

Theatre technicians are responsible for the smooth running of theatrical performances as far as technical aspects are concerned. They usually work in a team and are managed by a stage-manager.

Each technician has his own task according to his field of expertise. We have the following technical fields: lighting technician, sound technician, property master, scene-painter, costumier and the make-up artist.

Lighting technicians use lighting to interpret the moods that artistic directors wish to convey in their productions. They install and position the correct lighting equipment and operate it during productions.

The sound technician installs and maintains all sound equipment such as microphones and loudspeakers and positions them as required. He is also responsible for the pre-recording of the sound effects needed for various productions.

The property master designs, creates or acquires authentic properties or requisites and places them correctly for use during stage productions. He fixes all decor elements onto sliding stages or trucks.

The costumes needed are usually produced by the costumier. This technician must do research to determine the type of costume that should be produced for the play.

The scene-painter is responsible for painting the decor and the make-up artist must ensure that the actors portray the character he is acting - for example a clown.

TIMBER WOOD TECHNOLOGIST

see page 25

TOOL, JIG AND DIE MAKER

These artisans are master craftsmen whose products are used by operators to mass-produce other products and parts. In tool-making the artisans produce devices that hold metal while it is shaved, stamped or drilled.

They make gauges and measuring devices used in manufacturing precision parts. Jigs are devices used to clamp pieces of metal or other material in a required position and to guide the tools being used. This eliminates marking and positioning pieces of work individually. The artisans construct dies (forms) to shape metal used in stamping and forging operations. They also make moulds for diecasting and for moulding plastics. Tool, jig and die makers may also build and repair worn or damaged dies, gauges and fixtures.

TOPOGRAPHICAL AND ENGINEERING SURVEYOR

Surveying is the science of representing the layout of the land accurately on maps or plans, and indicating the exact position of any structure or other man-made or natural object, above or below ground. It plays a vital role in the planning, provision and maintenance of all forms of construction and development. The work is satisfying and offers a good balance of field and office work. Surveying comprises mainly two fields - topographical surveying and engineering.

Topographical surveying entails the gathering of information to map the forms of the earth. This is done by means of triangulation (measuring of angles), traversing, levelling (determining of heights), aerial photographs, calculating positions and heights, establishing place names, and annotating aerial photographs by indicating the topographical features. Back in his office, the surveyor applies all of this information to the task of preparing a detailed land map. He uses a photogrammetric machine to assist in the process.

Engineering surveying entails the collection of all relevant information on the site of a proposed construction project and mapping out the area. Once the design of the project is complete, the surveyor pegs it out on the actual site and also monitors construction in progress to ensure that it does not exceed his layout.

TRACTOR AND AGRICULTURAL MACHINERY MECHANIC

Tractor and agricultural machinery mechanics are required to maintain, repair and overhaul farm machinery, equipment and vehicles such as tractors, harvesters, pumps and tilling equipment.

They examine and listen to machines, motors and engines for defects. They dismantle defective units and repair or replace parts using various tools. They then reassemble, adjust and lubricate these parts to ensure that they operate efficiently. They may install and repair farm irrigation systems and maintain farm electrical systems. Mechanics must be able to work with both petrol and diesel engines and may occasionally have to do welding. They often have to work very quickly since farmers cannot afford to have important machinery out of order for long.

UPHOLSTERER

Upholsterers repair and rebuild sofas, chairs and other upholstered furniture. They remove the covering and padding from the seat, arms, sides and back of the piece being redone. The webbing is removed and replaced with new webbing. Any defective springs are removed and replaced with new or retied springs. Material is measured and cut for the new covering. The material is then sewn and attached to the frame. Finally, upholsterers add trimming, such as braid or buttons.

In addition, upholsterers may be required to refinish any wooden surfaces. Some upholsterers work with interior designers and others work directly with customers in determining the amount of work to be done and the type of fabric to be used.

VEHICLE BODY BUILDER

Vehicle body builders design and build chassis and bodies for vehicles like trucks, trailers, caravans, panel vans and buses. Working from plans, drawings and specifications, materials are measured out, sawn or cut to size and fitted and welded together to chassis. The floor of the bodywork is then manufactured and bolted onto the chassis. Metal beams are cut, welded together and reinforced to form a sturdy frame for the body. The panels of the body-work are made from various sizes and thicknesses of sheet metal panels which are welded or riveted together onto the framework. Different materials are used for the inside panels and to insulate soundproof where necessary. The vehicle body is then cleaned and painted and windows are installed and fitted. Finally, the electrical fittings and other trimmings are installed.

WALL AND FLOOR TILER

The wall and floor tiler applies tiles to floors, walls and ceilings according to design specifications. He examines plans, measures and marks surfaces to be tiled, and lays out the work. Metal laths are measured and cut to size for walls and ceilings with tin snips and tacked to surfaces with staple-guns or hammers. The tiler then spreads plaster base over the laths with a trowel, and levels it to a specified thickness. Concrete is spread on sub-floors with a trowel and then levelled with a screed. After the tiles have been cut and shaped with tile-cutters and biters, the tiler positions them and taps them with a trowel handle to affix them to plaster or adhesive base.

WEAVER

- see page 11

WELDER

The welder plays a key role in the manufacturing process. His work varies from repair and maintenance to welding, construction and manufacture.

The welder's skills are used in the construction and maintenance of pipelines, boilers, nuclear reactors, pressure vessels, motor cars, oil rigs and turbine castings. The welder must be competent in welding many types of metal, for example mild steel, stainless steel or aluminium, using various processes. Recognising welding defects and being able to correct them is also part of his job.

The welder must also be able to identify welding electrodes and filler wire compositions and know how to store and dry electrodes and fluxes. The three most common types of welding are electric arc, resistance and gas welding. Other methods include the use of electron beams and laser beams.

WOODCARVER

Universities

Introduction

Traditionally universities provide a broad general background to subjects that are more theoretical than practical, the aim being to provide an understanding of fundamental concepts in a particular discipline.

The title "degree" is the qualification awarded at the end of a three or four-year course of study at a university. Most universities however also offer shorter diploma and certificate courses in certain fields of study.

The minimum entrance requirement to a degree course at all universities is a Senior Certificate with Matriculation Endorsement. Entry to some degree courses requires specific essential subjects and the attainment of certain minimum symbols. Most diploma courses require a Senior Certificate (Std 10/Grade 12) for the purpose of admission.

For all degree courses there are more applicants than there are places and it is necessary for universities to employ selection procedures. These procedures may include a rating system, questionnaires, interviews and/or auditions.

How to use this section

- Course information is listed in alphabetical order by field of study.
- Use the index of fields of study at the end of this section to trace the field of study in which you are interested. The index will refer you to the relevant page number.
- Apply in time. Don't wait for your matric results! The application form must be obtained, completed and submitted before a particular closing date. Enrolment dates are determined annually.

Technikons

Introduction

Technikons are training institutions that aim to provide career-oriented education. They therefore strive to attain a balance between theory and application of theory in real-work situations. To achieve this aim, students have to spend some of their training time gaining theoretical knowledge at the technikon and some time at an approved place of work, learning the practical aspects of the job.

Students need to have at least a Senior Certificate (Std 10/Grade 12) or equivalent to be admitted to a technikon. A university entrance certificate is not essential.

Technikons offer a wide range of courses that lead to a certificate, diploma, higher diploma as well as Bachelor's, Master's and Doctoral Degrees in technology in selected fields of study. Fields of study include inter alia commerce/management, engineering, mining, art and design, communication technology, science and hotel management.

HIERARCHY OF TECHNIKON QUALIFICATIONS

6 yrs	D.Tech. Degree
5 yrs	M.Tech. Degree
4 yrs	National Higher Diploma or B.Tech. Degree
3 yrs	National Diploma
2 yrs	National Higher Certificate
1 yr	National Certificate

How to use this section

- Course information is listed in alphabetical order by field of study.
- Use the index of fields of study at the end of this section to trace the field of study in which you are interested. The index will refer you to a page number.
- Students who wish to pursue a B.Tech. Degree programme or who want to obtain a National Higher Diploma first have to register for a National Diploma. They may advance to undergraduate or higher diploma studies after completion of the National Diploma. The table on pages 67 - 69 shows the fields of study in which B.Tech. Degrees or National Higher Diplomas are offered.
- In addition to the instructional programmes listed in this section, technikons also offer a variety of short courses. Prospective students are advised to make further enquiries at the technikon of their choice.

Apply for admission to the course in good time. Don't wait for your matric results! The application form must be obtained, completed and submitted before a particular closing date. Enrolment dates are determined annually.

Private Colleges

Introduction

One of the major decisions facing a school leaver today is which private college to select. This is indeed a difficult decision as there are literally hundreds to choose from, many of which appear to offer the same courses. School leavers should become active consumers and check the standing and credentials of colleges in the community since a poor choice could prove very costly. The following are some guidelines to use when making this decision:

- Many private colleges are members of APCSA (Association of Private Colleges of Southern Africa). This association ensures that its members subscribe to a code of ethics. Should students believe that the college where they are enrolled has acted unethically or made false promises to them and, provided the college is a member of APCSA, they are then at liberty write to APCSA which will undertake to investigate the students' complaints regarding the college concerned. APCSA stresses that although it will not enter into litigation on a student's behalf, it will do its utmost to ensure that the situation is resolved to the satisfaction of the parties concerned.
- Many colleges have also chosen to affiliate themselves with the NCBTS (National Council for Business Training Standards) which offers students the facility of sitting for a national examination in subjects in respect of which there is no authoritative leading institute (for example PRISA or IMM). Allowing their students to sit for external examinations is also an important measure of the teaching standards of a college.
- Students should make every effort to arrange a formal interview at the college of their choice before making a final decision. This will enable them to assess the training facilities offered and to ask questions about the college's teaching methodology in a face-to-face situation. For example, where students have elected to attend a lecture-based college, they should not base their choice purely on the information contained in a brochure received in the post. They should rather undertake an in-depth investigation to assess whether this system would suit their individual needs.
- It is important to remember that although cost plays a role in the decision-making process, it is vitally important that students satisfy themselves that the college they choose to attend will make every effort to ensure that the qualifications they receive at the end of their studies will be recognised and accepted by the employer market.

Although the above information may assist you to make and informed choice, you should also seriously consider the following points:

- Think carefully about your career choice. Is this what you really want to do or are you simply emulating you friends?
- Does the career of your choice suit your personality and fit in with your long-term plans and career goals?
- What job opportunities exist for you in your chosen career field? Although you may be tempted to enter a specific field, you need to carefully consider the work opportunities that await you once you have completed your studies.

- Course information is listed in alphabetical order by field of study
- Use the index of fields of study at the end of this section to trace the field of study in which you are interested. The index will refer you to the relevant page number.
- Only courses with a duration of six months and more are listed in this section. Private colleges often also offer shorter courses, e.g. computer courses. Prospective students are advised to make further enquiries at the college of their choice.

PREAMBLE: ACCEPTANCE AND OBSERVANCE OF THIS CODE OF ETHICS IS A CONDITION OF MEMBERSHIP OF THE ASSOCIATION OF PRIVATE COLLEGES OF SOUTHERN AFRICA. THE MANAGEMENT COMMITTEE MAY, IN TERMS OF ARTICLE 7.6 OF THE CONSTITUTION, REPRIMAND, SUSPEND OR EXPEL ANY MEMBER WHO INFRINGES THE CODE OR WHO, IN ITS OPINION, CONDUCTS ITSELF IN ANY MANNER WHICH DISCREDITS THE ASSOCIATION.

1. No member shall:

1.1 wilfully or negligently fail to perform its general functions as an educationalist;

1.2 make false, misleading or unsubstantiated claims, whether by word of mouth or paid advertising or publicity;

1.3 question or make negative allegations in public as to the reputation of The Association of Private Colleges of Southern Africa or any of its committees or members;

1.4 cancel any educational or tuition course for which students have enrolled and paid, unless for good reason, and:

1.4.1 should such course be cancelled by the member prior to its commencement, the member shall forthwith refund to each student affected by such cancellation the fee paid by such student.

1.4.2 should such course be cancelled by the member after its commencement, the member shall forthwith refund to each student affected by such cancellation the actual amount of the fee paid by such student less appropriate pro rata amount to cover administrative fees and benefits received by the student.

1.5 postpone a course unless for good reason, and any student to whom postponement is not acceptable shall be entitled to a full refund of fees paid upon return of all issued materials that are in an acceptable condition.

For the purpose of Clauses 1.4 and 1.5 above, "good reason" shall be determined by the Management Committee at its sole and absolute discretion. The Management Committee shall only be entitled to decide whether a course has been cancelled for good reason or not on receipt of a written complaint from a student who claims to have been adversely affected by such cancellation and shall allow the member concerned to defend himself against any such complaints, the Management Committee taking whatever steps it feels necessary to right any wrongs that may have been committed.

2. A member shall:

2.1 conduct its activities at all times in a lawful, ethical and professional manner consistent with the promotion and maintenance of the integrity of the field of education and training and thereby enhance the image and reputation of the Association;

2.2 when providing tuition for externally examined courses, ensure that its educational or tuition course covers the syllabus/es prescribed by the relevant external examining bodies in their publications;

2.3 provide prospective students with an outline of their course curriculum and shall inform prospective students prior to their enrolment for an educational or tuition course of all the material terms and conditions of their enrolment, including the payment of fees;

2.4 conduct itself with fairness and reasonableness in all its dealings with its students or student representatives;

2.5 ensure that all lecturers/teachers employed by it for the purpose of providing educational training or tuition courses are suitably qualified to lecture thereon and conduct themselves during lectures in a professional manner and in accordance with educational standards and decorum;

2.6 provide suitable facilities in the tuition venue/s commensurate with generally acceptable standards;

2.7 provide essential equipment and/or training aids and/or course material that will be sufficient for the student to cover the course syllabus in the stated time;

2.8 conduct all examinations and evaluation procedures in the utmost good faith and in accordance with acceptable standard practice as regards venues, invigilation and confidentiality of examination papers and answer scripts;

2.9 encourage students to complete the educational or tuition course and take reasonable steps to ensure that all students receive the maximum benefit from the course, at least commensurate with the rules and regulations pertaining to examination procedures of the examining bodies and/or those stated in 2.8 above;

2.10 notwithstanding anything mentioned above, conduct its business ethically and shall not behave in a manner prejudicial to or likely to bring discredit upon the prestige and good reputation of the Association or its members.

"Wanna make it out there?"

START HERE!

"I want an education that prepares me for the job I've got to do. Look, I'll still need books, but what I really need is an education that takes me places. Out of the classroom and into the workplace, for instance. Where I'll get the 'hands-on' experience that's geared for the real world. That's why I'm studying at Wits Technikon. I mean, they've got a serious range of programmes. And now they've even got degrees as well. So if you want to make it out there, get an education with the right attitude. I can relate to that."

ART, DESIGN & ARCHITECTURE
BUSINESS MANAGEMENT

Technical Colleges

Introduction

Technical colleges are training institutions that aim at providing participants with the knowledge and skills that prepare them for specific trades or occupations. There is thus a strong emphasis on practical training.

Studies at the technical colleges are open to individuals who have passed at least Grade 9 (Std 7). For some of the courses, however, you may be required to have attained a higher standard, particularly in mathematics and science. The fields of study available at technical colleges include technical, commercial, the arts and cultural enrichment. Courses offered at technical colleges are referred to as National Technical Certificates
(N Certificates) and range from N1 to N6.

The following courses are available:

- **The National Intermediate Certificate (NIC)** is equivalent to N2 or Grade 11 (Std 9) and is usually followed by students who have completed Grade 9 (Std 7) and are at least 16 years old.
- **The National Senior Certificate (NSC)** is equivalent to a Senior Certificate (Std 10/Grade 12) and is followed by students who have completed the National Intermediate Certificate.
- **The National Certificate (N1-N3) and (N4-N6)** are referred to as "N" courses. The N1-N3 courses are usually followed by students who have completed Grade 9 (Std 7). (Mathematics and science may be required for certain fields of study). The N4-N6 courses are followed by students who have completed N3, Std 10/Grade 12 or NSC.
- **A National Diploma** is issued provided 12 applicable subjects from N4-N6 have been passed and the student has completed a period of 18 months of relevant experience at an approved place of employment.
- **The Government Certificate of Competency for Engineers** is awarded after the 18 prescribed subjects have been passed with an average mark of 50 % and a further two applicable subjects have been passed.

How to use this section

- The technical colleges are listed in alphabetical order with course information appearing below the college's name.
- Not all the technical colleges are listed as the relevant information was not available at the time of going to print. Please consult the complete address list of technical colleges in order to find a college that will suit you best.
- In addition to the formal courses listed in this section, technical colleges also offer a wide variety of enrichment and hobby courses, for example computer courses, language courses, photography, calligraphy, flower arranging, etc. Prospective students are advised to make enquiries at their nearest technical colleges.
- Apply for admission to the course in good time. Don't wait for your examination results! The application form must be obtained, completed and submitted before a particular closing date. Enrolment dates are determined annually.

Introduction

Once you have selected a suitable career and the type of tertiary institution you wish to attend, you need to start thinking about how you will finance your studies.

Lack of funds should not prevent you from attaining your goal. No deserving student should be unable to further his or her education on account of financial restraints.

FINANCIAL ASSISTANCE

There are several ways in which you can fund your studies. You may choose to work before you begin your studies, save your money and then pay for your studies yourself. You can also study part-time or work part-time in order to finance your studies. Alternatively, you can apply for a **scholarship**, **bursary** or **loan.**

A **scholarship** is a form of financial assistance given to scholars who have achieved outstanding academic results. This means that you must have obtained high marks in matric in order to qualify for a scholarship. Employment conditions are not usually attached to a scholarship. Financial aid differs from one scholarship to another. Some forms of aid provide for tuition and books only, whereas others cover all expenses.

A **bursary** is usually awarded on merit but may also be given to any promising student who needs the money. Bursaries sometimes have specific conditions attached to them. For example, you may have to work for the company that awarded the bursary during university holidays or for a specified period once you have completed your studies. Bursaries are awarded for one year, two years or for the entire period of study depending on your academic achievement. The amount of money differs from one bursary to another and may or may not cover all your expenses.

If you are unable to obtain a scholarship or a bursary, you may apply for a loan at a bank, training institution or university at a relatively low interest rate. However, it may be difficult to obtain a loan for your first year of study. Remember that you have to repay the loan, usually after completion of your studies. It is important to find out how much interest you will have to pay. The institution awarding the loan will also need someone other than yourself to guarantee that the money will be repaid if you are unable to repay the loan.

Remember to apply for scholarships, bursaries or loans in good time. The application form must be obtained, completed and submitted before the closing date indicated for the award. Do not apply for bursaries and loans for which you are not eligible as bursary donors usually adhere strictly to the conditions thereof.

How to use this section

The aim of this section is to provide a summary of the financial assistance that is available for obtaining a certificate, diploma or degree at a university, college or technikon. The bursaries, loans and other forms of financial aid are arranged in alphabetical order.

The following suggestions will help you find information on the awards:

- Awards are usually offered for a specific field of study and the index of fields of study is a useful aid for tracing the awards. Look for the field of study in which you are interested and consult the page numbers in order to locate the awards.
- Many awards are not connected to a specific field of study. These awards are listed under the section "Any field of study".
- Use the index of institutions where awards are tenable in the same way as the index of fields of study.

A.E. ROSENZWEIG BURSARY

ISCOR MINING

Realise your ambitions with an Iscor Mining bursary

Iscor Mining is really going places. We have set our sights on the ongoing expansion of Iscor's reserves, both locally and internationally and are in constant need of people who can help realise our vision.

Since we rely heavily on exploration and research, the training of prospective Mining Engineers is a top priority. We furthermore offer anually a number of bursaries to performance driven candidates interested in the following disciplines:

- B Eng Mining
- B Eng Metallurgy
- B Eng Mechanical
- B Eng Electrical
- B Eng Civil
- B Eng Industrial
- B Eng Geology

Bursary Coverage

The study bursary covers registration and class fees as well as accomodation fees. Also included is a cash allowance for books, a scientific calculator and computer subsidy.

Requirements

Our first interest is in dedicated people who are set on achieving 60% on the higher grade for Mathematics and Physical Science.
